July 21, 2025

Title Finite Mixtures of Mallows Models with Spearman Distance for Full and Partial Rankings

Version 2.0.0

Maintainer Cristina Mollica <cristina.mollica@uniroma1.it>

Description Fit and analysis of finite Mixtures of Mallows models with Spearman Distance for full and partial rankings with arbitrary missing positions. Inference is conducted within the maximum likelihood framework via Expectation-Maximization algorithms. Estimation uncertainty is tackled via diverse versions of bootstrapped and asymptotic confidence intervals. The most relevant reference of the methods is Crispino, Mollica, Astuti and Tardella (2023) <[doi:10.1007/s11222-023-10266-8](https://doi.org/10.1007/s11222-023-10266-8)>.

MSmix-package	<i>Finite Mixtures of Mallows Models with Spearman Distance for Full and Partial Rankings</i>
---------------	---

Description

The **MSmix** package provides functions to fit and analyze finite Mixtures of Mallows models with Spearman distance (a.k.a. θ -model) for full and partial rankings with arbitrary missing positions. Inference is conducted within the maximum likelihood (ML) framework via EM algorithms. Estimation uncertainty is tackled via diverse versions of bootstrapped and asymptotic confidence intervals.

Details

The *Mallows model* is one of the most popular and frequently applied parametric distributions to analyze rankings of a finite set of items. However, inference for this model is challenging due to the intractability of the normalizing constant, also referred to as *partition function*. The present package performs ML estimation (MLE) of the Mallows model with Spearman distance from full and partial rankings with arbitrary censoring patterns. Thanks to the novel approximation of the model normalizing constant introduced by Crispino, Mollica, Astuti and Tardella (2023), as well as the existence of a closed-form expression of the MLE of the consensus ranking, **MSmix** can address inference even for a large number of items. The package also allows to account for unobserved sample heterogeneity through MLE of *finite mixtures of Mallows models with Spearman distance* via EM algorithms, in order to perform a model-based clustering of partial rankings into groups with similar preferences.

Computational efficiency is achieved with the use of a hybrid language, combining R and C++ code, and the possibility of parallel computation.

In addition to inferential techniques, the package provides various functions for data manipulation, simulation, descriptive summary and model selection.

Specific S3 classes and methods are also supplied to enhance the usability and foster exchange with other packages.

The suite of functions available in the **MSmix** package is composed of:

Ranking data manipulation

`data_conversion` From rankings to orderings and vice versa.

`data_censoring` Censoring of full rankings.

`data_completion` Deterministic completion of partial rankings with full reference rankings.

`data_augmentation` Generate all full rankings compatible with partial rankings.

Ranking data simulation

`rMSmix` Random samples from finite mixtures of Mallows models with Spearman distance.

Ranking data description

`data_description` Descriptive summaries for partial rankings.

Model estimation

`fitMSmix` MLE of mixtures of Mallows models with Spearman distance via EM algorithms.

`likMSmix` Likelihood evaluation for mixtures of Mallows models with Spearman distance.

Model selection

`bicMSmix` BIC value for the fitted mixture of Mallows models with Spearman distance.

`aicMSmix` AIC value for the fitted mixture of Mallows models with Spearman distance.

Estimation uncertainty

`bootstrapMSmix` Bootstrap confidence intervals for mixtures of Mallows models with Spearman distance.

`confintMSmix` Asymptotic confidence intervals for mixtures of Mallows models with Spearman distance.

Spearman distance utilities

`spear_dist` Spearman distance computation for full rankings.

`spear_dist_distr` Spearman distance distribution under the uniform (null) model.

`partition_fun_spear` Partition function of the Mallows model with Spearman distance.

`expected_spear_dist` Expected Spearman distance under the Mallows model with Spearman distance.

`var_spear_dist` Variance of the Spearman distance under the Mallows model with Spearman distance.

S3 class methods

`print.bootMSmix` Print the bootstrap confidence intervals of mixtures of Mallows models with Spearman distance.

`print.data_descr` Print the descriptive statistics for partial rankings.

`print.emMSmix` Print the MLEs of mixtures of Mallows models with Spearman distance.

`print.summary.emMSmix` Print the summary of the MLEs of mixtures of Mallows models with Spearman distance.

`plot.bootMSmix` Plot the bootstrap confidence intervals of mixtures of Mallows models with Spearman distance.

`plot.data_descr` Plot the descriptive statistics for partial rankings.

`plot.dist` Plot the Spearman distance matrix for full rankings.

`plot.emMSmix` Plot the MLEs of mixtures of Mallows models with Spearman distance.

`summary.emMSmix` Summary of the MLEs of mixtures of Mallows models with Spearman distance.

Datasets

`ranks_antifragility` Antifragility features of innovative startups (full rankings with covariates).

`ranks_horror` Arkham Horror data (full rankings).

`ranks_beers` Beers data (partial rankings with different censoring patterns and a covariate).

`ranks_read_genres` Reading preference data (partial top-5 rankings with covariates).

`ranks_sports` Sport preferences and habits (full rankings with covariates).

Some quantities frequently recalled in the manual are the following:

N Sample size.

n Number of possible items.

G Number of mixture components.

Data must be supplied as an integer $N \times n$ matrix with partial rankings in each row and missing positions denoted as NA (rank = 1 indicates the most-liked item). Partial sequences with a single missing entry are automatically filled in, as they correspond to full rankings. In the present setting, ties are not allowed.

bicMSmix

BIC and AIC for mixtures of Mallows models with Spearman distance

Description

bicMSmix and aicMSmix compute, respectively, the Bayesian Information Criterion (BIC) and the Akaike Information Criterion (AIC) for a mixture of Mallows models with Spearman distance fitted on partial rankings.

Usage

```
bicMSmix(rho, theta, weights, rankings)
```

```
aicMSmix(rho, theta, weights, rankings)
```

Arguments

rho	Integer $G \times n$ matrix with the component-specific consensus rankings in each row.
theta	Numeric vector of G non-negative component-specific precision parameters.
weights	Numeric vector of G positive mixture weights (normalization is not necessary).
rankings	Integer $N \times n$ matrix or data frame with partial rankings in each row. Missing positions must be coded as NA.

Details

The (log-)likelihood evaluation is performed by augmenting the partial rankings with the set of all compatible full rankings (see [data_augmentation](#)), and then the marginal likelihood is computed.

When $n \leq 20$, the (log-)likelihood is exactly computed, otherwise it is approximated with the method introduced by Crispino et al. (2023). If $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

Value

The BIC or AIC value.

          rankings = rank_sim$samples)
aicMSmix(rho = rank_sim$rho, theta = rank_sim$theta, weights = rank_sim$weights,
          rankings = rank_sim$samples)
aicMSmix(rho = fit_em$mod$rho, theta = fit_em$mod$theta, weights = fit_em$mod$weights,
          rankings = rank_sim$samples)
aicMSmix(rho = fit_mcem$mod$rho, theta = fit_mcem$mod$theta, weights = fit_mcem$mod$weights,
          rankings = rank_sim$samples)

```

bootstrapMSmix	<i>Bootstrap confidence intervals for the fitted mixture of Mallows models with Spearman distance</i>
----------------	---

Description

Return the bootstrap confidence intervals for the parameters of a mixture of Mallows models with Spearman distance fitted on partial rankings.

plot method for class "bootMSmix".

Usage

```

bootstrapMSmix(
  object,
  n_boot = 50,
  type = (if (object$em_settings$n_clust == 1) "non-parametric" else "soft"),
  conf_level = 0.95,
  all = FALSE,
  n_start = 10,
  parallel = FALSE
)

## S3 method for class 'bootMSmix'
plot(x, ...)

```

Arguments

object	An object of class "emMSmix" returned by fitMSmix .
n_boot	Number of desired bootstrap samples. Defaults to 50.

type	Character indicating which bootstrap method must be used. Available options are: "non-parametric" or "parametric" for the $G = 1$ case, and "soft" or "separated" for the $G > 1$ case. Defaults to "non-parametric" when $n_clust = 1$ and to "soft" when $n_clust > 1$. See Details.
conf_level	Numeric: value in the interval (0,1] indicating the desired confidence level of the interval estimates. Defaults to 0.95.
all	Logical: whether the bootstrap samples of the MLEs for all the parameters must be returned. Defaults to FALSE.
n_start	Number of starting points for the MLE on each bootstrap sample. Defaults to 10.
parallel	Logical: whether parallelization over multiple initializations of the EM algorithm must be used. Used when rankings contains some partial rankings. Defaults to FALSE.
x	An object of class "bootMSmix" returned by bootstrapMSmix .
...	Further arguments passed to or from other methods (not used).

Details

When $n_clust = 1$, two types of bootstrap are available: 1) type = "non-parametric" (default); type = "parametric", where the latter supports full rankings only.

When $n_clust > 1$, two types of bootstrap are available: 1) type = "soft" (default), which is the soft-separated bootstrap (Crispino et al., 2025+) and returns confidence intervals for all the parameters of the mixture of Mallows models with Spearman distance; 2) type = "separated", which is the separated bootstrap (Taushanov and Berchtold, 2019) and returns bootstrap samples for the component-specific consensus rankings and precisions.

Value

An object of class "bootMSmix", namely a list with the following named components:

itemwise_ci_rho Character $G \times n$ matrix with the bootstrap itemwise confidence intervals for the component-specific consensus rankings.

ci_boot_theta Numeric $G \times 2$ matrix with the bootstrap confidence intervals for the component-specific precisions.

ci_boot_weights Numeric $G \times 2$ matrix with the bootstrap confidence intervals for the mixture weights. Returned when $n_clust > 1$ and type = "soft", otherwise NULL.

boot List containing all the n_boot bootstrap MLEs. Returned when $all = TRUE$, otherwise NULL.

The boot sublist contains the following named components:

rho_boot List of length n_clust . Each element is an integer $n_boot \times n_items$ matrix with rows containing the bootstrap MLEs of a component-specific consensus ranking.

theta_boot Numeric $n_boot \times n_clust$ matrix with the bootstrap MLEs of the component-specific precision parameters in each row.

weights_boot Numeric $n_boot \times n_clust$ matrix with the bootstrap MLEs of the mixture weights in each row. Returned when $n_clust > 1$ and type = "soft", otherwise NULL.

A list of 3 labelled plots, namely: i) rho_heatmap: a heatmap for the component-specific bootstrap consensus ranking estimates (when `n_clust > 1`, this is in turn a list of heatmaps for each consensus ranking estimate); ii) theta_density: a kernel density plot for the component-specific bootstrap precision estimates; iii) weights_density: a kernel density plot for the bootstrap mixture weight estimates is returned when `n_clust > 1` and the object `x` was obtained from the `bootstrapMSmix` routine with the argument `type = "soft"`, otherwise `NULL`.

Examples

```
## Example 1. Compute the bootstrap 95% confidence intervals for the Antifragility dataset.
# Let us assume no clusters.
r_antifrag <- ranks_antifragility[, 1:7]
set.seed(12345)
fit <- fitMSmix(rankings = r_antifrag, n_clust = 1, n_start = 1)
# Apply non-parametric bootstrap procedure.
set.seed(12345)
boot_np <- bootstrapMSmix(object = fit, n_boot = 200)
print(boot_np)
# Apply parametric bootstrap procedure and set all = TRUE
# to return the bootstrap MLEs of the consensus ranking.
set.seed(12345)
boot_p <- bootstrapMSmix(object = fit, n_boot = 200,
                        type = "parametric", all = TRUE)
print(boot_p)
# Plot the bootstrap estimates.
p_boot_p <- plot(boot_p)
p_boot_p$rho_heatmap()
p_boot_p$theta_density()

## Example 2. Compute the bootstrap 95% confidence intervals for the Antifragility dataset.
# Let us assume two clusters.
r_antifrag <- ranks_antifragility[, 1:7]
set.seed(12345)
fit <- fitMSmix(rankings = r_antifrag, n_clust = 2, n_start = 20)
# Apply soft bootstrap procedure and set all = TRUE
# to return the bootstrap MLEs of the consensus ranking.
set.seed(12345)
boot_soft <- bootstrapMSmix(object = fit, n_boot = 500,
                          n_start = 20, all = TRUE)
print(boot_soft)
# Plot the bootstrap estimates.
p_boot_soft <- plot(boot_soft)
```

```

p_boot_soft$rho_heatmap[[1]]()
p_boot_soft$rho_heatmap[[2]]()
p_boot_soft$theta_density()
p_boot_soft$weights_density()
# Apply separated bootstrap and compare results.
set.seed(12345)
boot_sep <- bootstrapMSmix(object = fit, n_boot = 500,
                           n_start = 20, type = "separated", all = TRUE)

print(boot_sep)
p_boot_sep <- plot(boot_sep)
p_boot_sep$rho_heatmap[[1]]()
p_boot_sep$rho_heatmap[[2]]()
p_boot_sep$theta_density()
print(boot_soft)
print(boot_sep)

```

confintMSmix	<i>Asymptotic confidence intervals for the fitted mixture of Mallows models with Spearman distance</i>
--------------	--

Description

Return the asymptotic confidence intervals of the continuous parameters (component-specific precisions and weights) of a mixture of Mallows models with Spearman distance fitted to full rankings. print method for class "ciMSmix".

Usage

```

confintMSmix(object, conf_level = 0.95)

## S3 method for class 'ciMSmix'
print(x, ...)

```

Arguments

object	An object of class "emMSmix" returned by fitMSmix .
conf_level	Numeric: value in the interval (0,1] indicating the desired confidence level of the interval estimates. Defaults to 0.95.
x	An object of class "ciMSmix" returned by confintMSmix .
...	Further arguments passed to or from other methods (not used).

Details

The current implementation of the asymptotic confidence intervals assumes that the observed rankings are complete.

Value

An object of class "ciMSmix", namely a list with the following named components:

`ci_theta` Numeric $G \times 2$ matrix with the confidence intervals of the component-specific precision parameters in each row.

`ci_weights` Numeric $G \times 2$ matrix with the confidence intervals of the mixture weights in each row (when $G > 1$), otherwise NULL.

Examples

```
## Example 1. Simulate rankings from a 2-component mixture of Mallows models
## with Spearman distance.
set.seed(123)
d_sim <- rMSmix(sample_size = 75, n_items = 8, n_clust = 2)
rankings <- d_sim$samples
# Fit the basic Mallows model with Spearman distance.
set.seed(123)
fit1 <- fitMSmix(rankings = rankings, n_clust = 1, n_start = 10)
# Compute the asymptotic confidence intervals for the MLEs of the precision.
ci95_fit1 <- confintMSmix(object = fit1)
print(ci95_fit1)
# Fit the true model.
set.seed(123)
fit2 <- fitMSmix(rankings = rankings, n_clust = 2, n_start = 10)
# Compute the asymptotic confidence intervals for the MLEs of the weights and precisions.
ci95_fit2 <- confintMSmix(object = fit2)
print(ci95_fit2)
```

data_augmentation

Data augmentation of partial rankings

Description

For a given partial ranking matrix, generate all possible full rankings which are compatible with each partially ranked sequence. Partial rankings with at most 10 missing positions and arbitrary patterns of censoring are supported.

Usage

```
data_augmentation(rankings, fill_single_na = TRUE)
```

Arguments

rankings	Integer $N \times n$ matrix or data frame with partial rankings in each row. Missing positions must be coded as NA.
fill_single_na	Logical: whether single missing positions in the row of rankings must be filled in prior to data augmentation. Defaults to TRUE.

Details

The data augmentation of a full ranking returns the complete ranking itself arranged in a row vector. The function can be applied on partial observations expressed in ordering format as well. A message informs the user when data augmentation may be heavy.

Value

A list of N elements corresponding to the matrices of full rankings compatible with each partial sequence.

References

Crispino M, Mollica C, Astuti V and Tardella L (2023). Efficient and accurate inference for mixtures of Mallows models with Spearman distance. *Statistics and Computing*, **33**(98), DOI: 10.1007/s11222-023-10266-8.

Examples

```
## Example 1. Data augmentation of a single partial top-9 ranking.
data_augmentation(c(3, 7, 5, 1, NA, 4, NA, 8, 2, 6, NA, 9))

## Example 2. Data augmentation of partial ranking matrix with different censoring patterns.
rank_data <- rbind(c(NA, 4, NA, 1, NA),
                  c(NA, NA, NA, NA, 1),
                  c(2, NA, 1, NA, 3),
                  c(4, 2, 3, 5, 1),
                  c(NA, 4, 1, 3, 2))
data_augmentation(rank_data)
```

data_censoring	<i>Censoring of full rankings</i>
----------------	-----------------------------------

Description

Convert full rankings into either top-k rankings or into partial rankings with missing data in arbitrary positions.

Usage

```
data_censoring(
  rankings,
  topk = TRUE,
  nranked = NULL,
  probs = rep(1, ncol(rankings) - 1)
)
```

Arguments

rankings	Integer $N \times n$ matrix or data frame with full rankings in each row.
topk	Logical: whether the full rankings must be converted into top-k rankings (TRUE) or into partial rankings with missing data in arbitrary positions (FALSE). Defaults to TRUE.
nranked	Integer vector of length N with the desired number of positions to be retained in each partial sequence after censoring. If nranked = NULL (default), the number of positions are randomly generated according to the probabilities in the probs argument.
probs	Numeric vector of the $(n - 1)$ probabilities for the random generation of the number of positions to be retained in each partial sequence after censoring (normalization is not necessary). Used only if nranked = NULL. Defaults to equal probabilities.

Details

Both forms of partial rankings can be obtained into two ways: (i) by specifying, in the nranked argument, the number of positions to be retained in each partial ranking; (ii) by setting nranked = NULL (default) and specifying, in the probs argument, the probabilities of retaining respectively 1, 2, ..., $(n - 1)$ positions in the partial rankings (recall that a partial sequence with $(n - 1)$ observed entries corresponds to a full ranking).

When topk = FALSE, the exact positions that must be retained into the partial sequences after censoring are uniformly generated, regardless of the specification of the nranked argument.

Value

A list of two named objects:

`part_rankings` Integer $N \times n$ matrix with partial (censored) rankings in each row. Missing positions are coded as NA.

`nranked` Integer vector of length N with the actual number of items ranked in each partial sequence after censoring.

Examples

```
## Example 1. Censoring the Antifragility dataset into partial top rankings
# Top-3 censoring (assigned number of top positions to be retained)
n <- 7
r_antifrag <- ranks_antifragility[, 1:n]
data_censoring(r_antifrag, topk = TRUE, nranked = rep(3,nrow(r_antifrag)))
# Random top-k censoring with assigned probabilities
set.seed(12345)
data_censoring(r_antifrag, topk = TRUE, probs = 1:(n-1))

## Example 2. Simulate full rankings from a basic Mallows model with Spearman distance
n <- 10
N <- 100
set.seed(12345)
rankings <- rMSmix(sample_size = N, n_items = n)$samples
# Censoring in arbitrary positions with assigned number of ranks to be retained
set.seed(12345)
nranked <- round(runif(N,0.5,1)*n)
set.seed(12345)
arbitr_ranks1 <- data_censoring(rankings, topk = FALSE, nranked = nranked)
arbitr_ranks1
identical(arbitr_ranks1$nranked, nranked)
# Censoring in arbitrary positions with random number of ranks to be retained
set.seed(12345)
probs <- runif(n-1, 0, 0.5)
set.seed(12345)
arbitr_ranks2 <- data_censoring(rankings, topk = FALSE, probs = probs)
arbitr_ranks2
prop.table(table(arbitr_ranks2$nranked))
round(prop.table(probs), 2)
```

data_completion

Completion of partial rankings with reference full rankings

Description

Deterministic completion of partial rankings with the relative positions of the unranked items in the reference full rankings. Partial rankings with arbitrary patterns of censoring are supported.

Usage

```
data_completion(rankings, ref_rho)
```

Arguments

- rankings

Integer $N \times n$ matrix or data frame with the partial rankings to be completed in each row. Missing positions must be coded as NA.
- ref_rho

Integer $N \times n$ matrix or data frame whose rows represent the reference full rankings to be used to complete the partial rankings.

Details

The arguments `rankings` and `ref_rho` must be objects with the same class (matrix or data frame) and same dimensions.

The completion of a full ranking returns the complete ranking itself.

Value

Integer $N \times n$ matrix with the completed rankings in each row.

References

Crispino M, Mollica C and Modugno L (2025+). MSmix: An R Package for clustering partial rankings via mixtures of Mallows Models with Spearman distance. (*submitted*)

Examples

```
## Example 1. Completion of a single partial ranking.
data_completion(rankings = c(3, NA, NA, 1, NA), ref_rho = c(4, 5, 1, 3, 2))

## Example 2. Completion of partial rankings with arbitrary censoring patterns.
rankings <- rbind(c(3, NA, NA, 7, 2, NA, NA), c(NA, 6, NA, 5, NA, NA, 1),7:1)
data_completion(rankings = rankings, ref_rho = rbind(c(4, 5, 6, 1, 3, 7, 2),
  7:1, 1:7))
```

data_conversion	Switch data format from rankings to orderings and vice versa
-----------------	--

Description

Convert the format of the input dataset from rankings to orderings and vice versa. Differently from existing analogous functions supplied by other R packages, `data_conversion` supports also partial rankings/orderings with arbitrary patterns of censoring.

Usage

```
data_conversion(data, subset = NULL)
```

Arguments

data	Integer $N \times n$ matrix with partial sequences (either rankings or orderings) in each row, whose format has to be converted. Missing entries must be coded as NA.
subset	Optional logical or integer vector specifying the subset of observations, i.e. rows of data, to be kept. Missing values are taken as FALSE. Defaults to NULL meaning that all the rows are considered.

Value

Integer $N \times n$ matrix of partial sequences with inverse format with respect to the input data.

Examples

```
## Example 1. Switch the data format for a single complete observation.
data_conversion(c(4, 5, 1, 3, 2))

## Example 2. Switch the data format for partial sequences with arbitrary censoring patterns.
data_conversion(rbind(c(NA, 2, 5, NA, NA), c(4, NA, 2, NA, 3), c(4, 5, 1, NA, NA),
                     c(NA, NA, NA, NA, 2), c(NA, 5, 2, 1, 3), c(3, 5, 1, 2, 4)))
```

data_description	<i>Descriptive summaries for partial rankings</i>
------------------	---

Description

Compute various data summaries for a partial ranking dataset. Differently from existing analogous functions supplied by other R packages, data_description supports partial observations with arbitrary patterns of censoring.

print method for class "data_descr".

Usage

```
data_description(
  rankings,
  marg = TRUE,
  borda_ord = FALSE,
  paired_comp = TRUE,
  subset = NULL,
  item_names = NULL
)

## S3 method for class 'data_descr'
print(x, ...)
```

Arguments

rankings	Integer $N \times n$ matrix or data frame with partial rankings in each row. Missing positions must be coded as NA.
marg	Logical: whether the first-order marginals have to be computed. Defaults to TRUE.
borda_ord	Logical: whether, in the summary statistics, the items must be ordered according to the Borda ranking (i.e., mean rank vector). Defaults to FALSE.
paired_comp	Logical: whether the pairwise comparison matrix has to be computed. Defaults to TRUE.
subset	Optional logical or integer vector specifying the subset of observations, i.e. rows of rankings, to be kept. Missing values are taken as FALSE. Defaults to NULL meaning that all the rows are considered.
item_names	Character vector with the names to be used for the items. Defaults to NULL, meaning that <code>colnames(rankings)</code> is used and, if not available, <code>item_names</code> is set equal to "Item1", "Item2",
x	An object of class "data_descr" returned by data_description .
...	Further arguments passed to or from other methods (not used).

Details

The implementation of `data_description` is similar to that of `rank_summaries` from the PLMIX package. Differently from the latter, `data_description` works with any kind of partial rankings (not only top rankings) and allows to summarize subsamples thanks to the additional `subset` argument.

The Borda ranking, obtained from the ordering of the mean rank vector, corresponds to the MLE of the consensus ranking of the Mallows model with Spearman distance. If `mean_rank` contains some NAs, the corresponding items occupy the bottom positions in the `borda_ordering` according to the order they appear in `item_names`.

Value

An object of class "data_descr", which is a list with the following named components:

n_ranked	Integer vector of length N with the number of items ranked in each partial sequence.
n_ranked_distr	Frequency distribution of the <code>n_ranked</code> vector.
n_ranks_by_item	Integer $3 \times n$ matrix with the number of times that each item has been ranked or not. The last row contains the total by column, i.e. the sample size N .
mean_rank	Mean rank vector.
borda_ordering	Character vector corresponding to the Borda ordering. This is obtained from the ranking of the mean rank vector.
marginals	Integer $n \times n$ matrix of the first-order marginals in each column: the (j, i) -th entry indicates the number of times that item i is ranked in position j .

pc	Integer $n \times n$ pairwise comparison matrix: the (i, i') -th entry indicates the number of times that item i is preferred to item i' .
rankings	When <code>borda_ord = TRUE</code> , an integer $N \times n$ matrix corresponding to rankings with columns rearranged according to the Borda ordering, otherwise the input rankings.

expected_spear_dist	<i>Expectation of the Spearman distance</i>
---------------------	---

Description

Compute (either the exact or the approximate) (log-)expectation of the Spearman distance under the Mallows model with Spearman distance.

Usage

```
expected_spear_dist(theta, n_items, log = TRUE)
```

Arguments

theta	Non-negative precision parameter.
n_items	Number of items.
log	Logical: whether the expected Spearman distance on the log scale must be returned. Defaults to TRUE.

Details

When $n \leq 20$, the expectation is exactly computed by relying on the Spearman distance distribution provided by OEIS Foundation Inc. (2023). When $n > 20$, it is approximated with the method introduced by Crispino et al. (2023) and, if $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

The expected Spearman distance is independent of the consensus ranking of the Mallows model with Spearman distance due to the right-invariance of the metric. When $\theta = 0$, this is equal to $\frac{n^3-n}{6}$, which is the expectation of the Spearman distance under the uniform (null) model.

Value

Either the exact or the approximate (log-)expected value of the Spearman distance under the Mallows model with Spearman distance.

fitMSmix

MLE of mixtures of Mallows models with Spearman distance via EM algorithms

Description

Perform the MLE of mixtures of Mallows model with Spearman distance on full and partial rankings via EM algorithms. Partial rankings with missing data in arbitrary positions are supported.

print method for class "emMSmix".

Usage

```

fitMSmix(
  rankings,
  n_clust = 1,
  n_start = 1,
  n_iter = 200,
  mc_em = FALSE,
  eps = 10-6,
  init = list(list(rho = NULL, theta = NULL, weights = NULL))[rep(1, n_start)],
  plot_log_lik = FALSE,
  comp_log_lik_part = FALSE,
  plot_log_lik_part = FALSE,
  parallel = FALSE,
  theta_max = 3,
  theta_tol = 1e-05,
  theta_tune = 1,
  subset = NULL,
  item_names = NULL
)

```

```
## S3 method for class 'emMSmix'
print(x, ...)
```

Arguments

rankings	Integer $N \times n$ matrix or data frame with partial rankings in each row. Missing positions must be coded as NA.
n_clust	Number of mixture components. Defaults to 1.
n_start	Number of starting points. Defaults to 1.
n_iter	Maximum number of EM iterations. Defaults to 200.
mc_em	Logical: whether the Monte Carlo EM algorithm must be used for MLE on partial rankings completion, see Details. Ignored when rankings does not contain any partial sequence. Defaults to FALSE.
eps	Positive tolerance value for the convergence of the EM algorithm. Defaults to 10^{-6} .
init	List of n_start lists with the starting values of the parameters to initialize the EM algorithm. Each list must contain three named objects, namely: 1) rho: integer $G \times n$ matrix with the component-specific consensus rankings in each row; 2) theta: numeric vector of G non-negative component-specific precision parameters; 3) weights: numeric vector of G positive mixture weights. Defaults to NULL, meaning that the starting points are automatically generated from the uniform distribution.
plot_log_lik	Logical: whether the iterative log-likelihood values (based on full or augmented rankings) must be plotted. Defaults to FALSE.
comp_log_lik_part	Logical: whether the maximized observed-data log-likelihood value (based on partial rankings) must be returned. Ignored when rankings does not contain any partial sequence or data_augmentation cannot be applied. See Details. Defaults to FALSE.
plot_log_lik_part	Logical: whether the iterative observed-data log-likelihood values (based on partial rankings) must be plotted. Ignored when rankings does not contain any partial sequence. In the presence of partial rankings, this argument is ignored when comp_log_lik_part = FALSE or data_augmentation cannot be applied. Defaults to FALSE.
parallel	Logical: whether parallelization over multiple initializations must be used. Defaults to FALSE.
theta_max	Positive upper bound for the precision parameters. Defaults to 3.
theta_tol	Positive convergence tolerance for the M-step of the precision parameters. Defaults to 10^{-5} .
theta_tune	Positive tuning constant affecting the precision parameters in the Monte Carlo step. Ignored when rankings does not contain any partial sequence or mc_em = FALSE. Defaults to 1.
subset	Optional logical or integer vector specifying the subset of observations, i.e. rows of the rankings, to be kept. Missing values are taken as FALSE. Defaults to NULL meaning that all the rows are considered.

<code>item_names</code>	Character vector with the names to be used for the items. Defaults to <code>NULL</code> , meaning that <code>colnames(rankings)</code> is used and, if not available, <code>item_names</code> is set equal to <code>"Item1", "Item2", ...</code> .
<code>x</code>	An object of class <code>"emMSmix"</code> returned by <code>fitMSmix</code> .
<code>...</code>	Further arguments passed to or from other methods (not used).

Details

The EM algorithms are launched from `n_start` initializations and the best solution in terms of maximized log-likelihood value (based on full or augmented rankings) is returned.

When `mc_em = FALSE`, the scheme introduced by Crispino et al. (2023) is performed, where partial rankings are augmented with all compatible full rankings. This type of data augmentation is supported up to 10 missing positions in the partial rankings.

When `mc_em = TRUE`, the - computationally more efficient - Monte Carlo EM algorithm introduced by Crispino et al. (2025+) is implemented. In the case of a large number of censored positions and sample sizes, the `mc_em = TRUE` must be preferred.

Regardless of the fitting method adopted for inference on partial rankings, note that setting the argument `comp_log_lik_part = TRUE` for the computation of the observed-data log-likelihood values (based on partial rankings) can slow down the procedure in the case of a large number of censored positions and sample sizes.

Value

An object of class `"emMSmix"`, namely a list with the following named components:

<code>mod</code>	List of named objects describing the best fitted model in terms of maximized log-likelihood over the <code>n_start</code> initializations. See Details.
<code>max_log_lik</code>	Maximized log-likelihood values for each initialization.
<code>partial_data</code>	Logical: whether the dataset includes some partially-ranked sequences.
<code>convergence</code>	Binary convergence indicators of the EM algorithm for each initialization: 1 = convergence has been achieved, 0 = otherwise.
<code>record</code>	Best log-likelihood values sequentially achieved over the <code>n_start</code> initializations.
<code>em_settings</code>	List of settings used to fit the model.
<code>call</code>	The matched call.

The `mod` sublist contains the following named objects:

<code>rho</code>	Integer $G \times n$ matrix with the MLEs of the component-specific consensus rankings in each row.
<code>theta</code>	Numeric vector with the MLEs of the G component-specific precision parameters.
<code>weights</code>	Numeric vector with the MLEs of the G mixture weights.
<code>z_hat</code>	Numeric $N \times G$ matrix of the estimated posterior component membership probabilities. Returned when <code>n_clust > 1</code> , otherwise <code>NULL</code> .
<code>map_classification</code>	Integer vector of N mixture component memberships based on the MAP allocation from the <code>z_hat</code> matrix. Returned when <code>n_clust > 1</code> , otherwise <code>NULL</code> .

- `log_lik` Numeric vector of the log-likelihood values (based on full or augmented rankings) at each iteration.
- `best_log_lik` Maximized log-likelihood value (based on full or augmented rankings) of the fitted model.
- `bic` BIC value of the fitted model based on `best_log_lik`.
- `log_lik_part` Numeric vector of the observed-data log-likelihood values (based on partial rankings) at each iteration. Returned when rankings contains some partial sequences that can be completed with `data_augmentation` and `plot_log_lik_part = TRUE`, otherwise NULL. See Details.
- `best_log_lik_part` Maximized observed-data log-likelihood value (based on partial rankings) of the fitted model. Returned when rankings contains some partial sequences that can be completed with `data_augmentation`, otherwise NULL. See Details.
- `bic_part` BIC value of the fitted model based on `best_log_lik_part`. Returned when rankings contains some partial sequences that can be completed with `data_augmentation`, otherwise NULL. See Details.
- `conv` Binary convergence indicator of the best fitted model: 1 = convergence has been achieved, 0 = otherwise.
- `augmented_rankings` Integer $N \times n$ matrix with rankings completed through the Monte Carlo step in each row. Returned when rankings contains some partial sequences and `mc_em = TRUE`, otherwise NULL.

likMSmix	<i>(Log-)likelihood for mixtures of Mallows models with Spearman distance</i>
----------	---

Description

Compute the (log-)likelihood for the parameters of a mixture of Mallows models with Spearman distance on partial rankings. Partial rankings with missing data in arbitrary positions are supported.

Usage

```
likMSmix(
  rho,
  theta,
  weights = (if (length(theta) == 1) NULL),
  rankings,
  log = TRUE
)
```

Arguments

rho	Integer $G \times n$ matrix with the component-specific consensus rankings in each row.
theta	Numeric vector of G non-negative component-specific precision parameters.
weights	Numeric vector of G positive mixture weights (normalization is not necessary).
rankings	Integer $N \times n$ matrix or data frame with partial rankings in each row. Missing positions must be coded as NA.
log	Logical: whether the log-likelihood must be returned. Defaults to TRUE.

Details

The (log-)likelihood evaluation is performed by augmenting the partial rankings with the set of all compatible full rankings (see [data_augmentation](#)), and then the marginal likelihood is computed.

When $n \leq 20$, the (log-)likelihood is exactly computed. When $n > 20$, the model normalizing constant is not available and is approximated with the method introduced by Crispino et al. (2023). If $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

Value

The (log)-likelihood value.

```

partition_fun_spear	<i>Partition function of the Mallows model with Spearman distance</i>
---------------------	---

Description

Compute (either the exact or the approximate) (log-)partition function of the Mallows model with Spearman distance.

Usage

```
partition_fun_spear(theta, n_items, log = TRUE)
```

Arguments

theta	Non-negative precision parameter.
n_items	Number of items.
log	Logical: whether the partition function must be returned on the log scale. Defaults to TRUE.

Details

When $n \leq 20$, the partition function is exactly computed by relying on the Spearman distance distribution provided by OEIS Foundation Inc. (2023). When $n > 20$, it is approximated with the method introduced by Crispino et al. (2023) and, if $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

The partition function is independent of the consensus ranking of the Mallows model with Spearman distance due to the right-invariance of the metric. When $\theta = 0$, the partition function is equivalent to $n!$, which is the normalizing constant of the uniform (null) model.

Value

Either the exact or the approximate (log-)partition function of the Mallows model with Spearman distance.

plot.data_descr

Plot descriptive statistics for partial rankings

Description

plot method for class "data_descr".

Usage

```
## S3 method for class 'data_descr'
plot(
  x,
  cex_text_mean = 1,
  cex_symb_mean = 12,
  marg_by = "item",
  cex_text_pc = 3,
  cex_range_pc = c(8, 20),
  ...
)
```

Arguments

<code>x</code>	An object of class "data_descr" returned by data_description .
<code>cex_text_mean</code>	Positive scalar: the magnification to be used for all the labels in the plot for the mean rank vector. Defaults to 1.
<code>cex_symb_mean</code>	Positive scalar: the magnification to be used for the symbols in the pictogram of the mean rank vector. Defaults to 12.
<code>marg_by</code>	Character indicating whether the marginal distributions must be reported by "item" or by "rank" in the heatmap. Defaults to "item".
<code>cex_text_pc</code>	Positive scalar: the magnification to be used for all the labels in the bubble plot of the paired comparison frequencies. Defaults to 3.
<code>cex_range_pc</code>	Numeric vector indicating the range of values to be used on each axis in the bubble plot of the paired comparison frequencies. Defaults to <code>c(8, 20)</code> .
<code>...</code>	Further arguments passed to or from other methods (not used).

Details

The plots of the marginals distributions and pairwise comparisons are constructed if the object `x` was obtained from the `data_description` routine with arguments `marg = TRUE` and `pc = TRUE`; otherwise, a NULL element in the output list is returned.

Value

A list of 5 labelled plots displaying descriptive summaries of the partial ranking dataset, namely: i) `n_ranked_distr`: a barplot of the frequency distribution (%) of the number of items actually ranked in each partial sequence, ii) `picto_mean_rank`: a basic pictogram of the mean rank vector, iii) `marginals`: a heatmap of the marginal distributions (either by item or by rank), iv) `ecdf`: the ecdf of the marginal rank distributions and v) `pc`: a bubble plot of the pairwise comparison matrix.

```
## Example 1. Plot the mean rank vector and marginal distributions for the Antifragility dataset.
r_antifrag <- ranks_antifragility[, 1:7]
desc <- data_description(r_antifrag)
p_desc <- plot(desc)
p_desc$picto_mean_rank()
p_desc$marginals()

## Example 2. Plot the distribution of the number of ranked items and the
# pairwise comparison matrix for the Sports dataset.
r_sports <- ranks_sports[, 1:8]
desc <- data_description(rankings = r_sports, borda_ord = TRUE)
p_desc <- plot(desc, cex_text_mean = 1.2)
p_desc$n_ranked_distr()
p_desc$pc()

## Example 3. Plot the ecdf's for the marginal rank distributions for the Sports dataset by gender.
r_sports <- ranks_sports[, 1:8]
desc_f <- data_description(rankings = r_sports, subset = (ranks_sports$Gender == "Female"))
p_desc_f <- plot(desc_f, cex_text_mean = 1.2)
p_desc_f$ecdf()
desc_m <- data_description(rankings = r_sports, subset = (ranks_sports$Gender == "Male"))
p_desc_m <- plot(desc_m, cex_text_mean = 1.2)
p_desc_m$ecdf()
```

plot.dist

*Plot the Spearman distance matrix***Description**

plot method for class "dist". It displays a heatmap which is useful to preliminarily explore the presence of patterns (groups) of similar preferences in the ranking dataset.

Usage

```
## S3 method for class 'dist'
plot(
  x,
  order = TRUE,
  show_labels = TRUE,
  lab_size = 3,
  gradient = list(low = "#00AFBB", mid = "white", high = "#FC4E07"),
  ...
)
```

Arguments

x	An object of class "dist", returned by <code>spear_dist</code> when setting the argument <code>rho = NULL</code> .
order	Logical: whether the rows of the distance matrix must be ordered. Defaults to TRUE.
show_labels	Logical: whether the labels must be displayed on the axes. Defaults to TRUE.
lab_size	Positive scalar: the magnification of the labels on the axes. Defaults to 3.
gradient	List of three elements with the colors for low, mid and high values of the distances in the heatmap. The element mid can take the value NULL.
...	Further arguments passed to or from other methods (not used).

Details

`plot.dist` can visualize a distance matrix of any metric, provided that its class is "dist". It can take a few seconds if the size of the distance matrix is large.

The heatmap can be also obtained by setting the arguments `rho = NULL` and `plot_dist_mat = TRUE` when applying `spear_dist`.

Value

A heatmap of the Spearman distance matrix between all pairs of full rankings.

```

plot.emMSmix	<i>Plot the MLEs for the fitted mixture of Mallows models with Spearman distance</i>
--------------	--

Description

plot method for class "emMSmix".

Usage

```
## S3 method for class 'emMSmix'
plot(x, max_scale_w = 20, mar_lr = 0.4, mar_tb = 0.2, ...)
```

Arguments

x	An object of class "emMSmix" returned by fitMSmix .
max_scale_w	Positive scalar: maximum magnification of the dots in the bump plot, set proportional to the MLEs of the weights. Defaults to 20.
mar_lr	Numeric: margin for the left and right side of the plot. Defaults to 0.4.
mar_tb	Numeric: margin for the bottom and top side of the plot. Defaults to 0.2.
...	Further arguments passed to or from other methods (not used).

Value

A list of 2 labelled plots, namely: i) bump_plot: a bump plot comparing the component-specific consensus rankings of the fitted mixture of Mallows models with Spearman distance (the size of the dots of each consensus ranking is proportional to the weight of the corresponding component); and ii) est_clust_prob: a heatmap of the estimated component membership probabilities is returned when n_clust > 1, otherwise NULL.

<code>ranks_antifragility</code>	<i>Antifragility Data (complete rankings with covariates)</i>
----------------------------------	---

Description

The Antifragility dataset came up from an on-line survey conducted during spring 2021 by Sapienza University of Rome in collaboration with the Italian incubator Digital Magics, to investigate the construct of antifragility in innovative startups. Antifragility reflects the capacity of a company to adapt and improve its activity in the case of stresses, volatility and disorders triggered by critical and unexpected events, such as the COVID-19 outbreak which motivated the survey. On the basis of their experience and knowledge, a sample of $N = 99$ startups provided their complete rankings of $n = 7$ desirable antifragility properties in order of importance. The antifragility features are: 1 = Absorption, 2 = Redundancy, 3 = Small stressors, 4 = Non-monotonicity, 5 = Requisite variety, 6 = Emergence and 7 = Uncoupling.

Usage

```
data(ranks_antifragility)
```

Format

A data frame gathering $N = 99$ complete rankings of the $n = 7$ antifragility features in each row (rank 1 = most preferred item). The definition of the antifragility aspects is detailed below:

Absorption Ability to absorb stress and shocks while remaining in the planned state.

Redundancy Overcapacity to defend from risks and prevent faults.

Small_stressors Ability to exert low levels of stress on the organization.

Non_monotonicity Capacity to learn from failures and errors.

Requisite_variety Need for regulatory agents (i.e., government agency) to monitor and control organization's outcomes and behaviors.

Emergence Existence of cause-effect relationships between organization's activity at micro level and its outcomes at macro level.

Uncoupling Existence of strong interconnection between agents inside and outside the organization.

Industry_sector Industry sector of the startup.

Market Market type in which the startup operates.

Innovation_type Main innovation type of the startup.

Approach_to_crisis Main approach implemented by the startup during Covid-19 outbreak.

Crisis_impact Impact of Covid-19 outbreak on the startup.

Age Age of the startup (years).

N_employees Number of employees in the startup.

Region Italian region of the startup.

Job_title Job title of the startup participant in the survey.

Experience Years of job experience of the startup participant in the survey.

ranks_beers

*Beers Data (partial rankings with covariate)***Description**

The Beers dataset was collected through an on-line survey on beer preferences administrated to the participants of the 2018 Pint of Science festival held in Grenoble. A sample of $N = 105$ respondents provided their partial rankings of $n = 20$ beers according to their personal preferences. The dataset also includes a covariate concerning respondents' residence.

Usage

```
data(ranks_beers)
```

Format

A data frame gathering $N = 105$ partial rankings of the beers in the first $n = 20$ columns (rank 1 = most preferred item) and an individual covariate in the last column. The partial rankings are characterized by different censoring patterns (that is, not exclusively top sequences), with missing positions coded as NA. The variables are detailed below:

Stella Rank assigned to Stella Artois.

Kwak Rank assigned to Kwak Brasserie.

KronKron Rank assigned to Kronenbourg (Kronenbourg).

Faro Rank assigned to Faro Timmermans.

Kron1664 Rank assigned to 1664 (Kronenbourg).

Chimay Rank assigned to Chimay Triple.

Pelforth Rank assigned to Pelforth Brune.

KronCarls Rank assigned to Carlsberg (Kronenbourg).

KronKanter Rank assigned to Kanterbraeu (Kronenbourg).

Hoegaarden Rank assigned to Hoegaarden Blanche.

Grimbergen Rank assigned to Grimbergen Blonde.

Pietra Rank assigned to Pietra Brasserie.

Affligem Rank assigned to Affligem Brasserie.

Goudale Rank assigned to La Goudale.

Leffe Rank assigned to Leffe Blonde.

Heineken Rank assigned to Heineken.

Duvel Rank assigned to Duvel Brasserie.

Choulette Rank assigned to La Choulette.

Orval Rank assigned to Orval.

Karmeliet Rank assigned to Karmeliet Triple.

Residence Residence.

ranks_horror	<i>Arkham Horror Data (complete rankings)</i>
--------------	---

Description

The Arkham Horror dataset came up from an on-line survey conducted by Curtis Miller to investigate popularity of different player roles of *Arkham Horror: The Card Game*. A sample of $N = 241$ respondents provided their complete rankings of $n = 5$ player modes in order of preference. The player roles are: 1 = Survivor, 2 = Rogue, 3 = Guardian, 4 = Seeker, 5 = Mystic. Statistical analyses of these data can be found at the links provided in References.

Usage

```
data(ranks_horror)
```

Format

A data frame gathering $N = 421$ complete rankings of the $n = 5$ player roles in each row (rank 1 = most preferred item). The variables are detailed below:

Survivor Rank assigned to Survivor role.

Rogue Rank assigned to Rogue role.

Guardian Rank assigned to Guardian role.

Seeker Rank assigned to Seeker role.

Mystic Rank assigned to Mystic role.

ranks_read_genres	<i>Reading Genres Data (partial rankings with covariates)</i>
-------------------	---

Description

The Reading Genres dataset was collected through an on-line survey conducted in Italy to investigate reading preferences in the context of the 2019 project *Patto per la lettura – Conta chi legge*. The questionnaire was administrated by the municipality of Latina (Latium, Italy), in collaboration with Sapienza University of Rome and the School of Government of the University of Tor Vergata. A sample of $N = 507$ respondents provided their partial top-5 rankings of $n = 11$ reading genres according to their personal preferences. The reading genres are: 1 = Classic, 2 = Novel, 3 = Thriller, 4 = Fantasy, 5 = Biography, 6 = Teenage, 7 = Horror, 8 = Comics, 9 = Poetry, 10 = Essay and 11 = Humor. The dataset also includes several covariates concerning respondents' socio-demographics characteristics and other free time activities.

Usage

```
data(ranks_read_genres)
```

Format

A data frame gathering $N = 507$ partial top-5 rankings of the reading genres in the first $n = 11$ columns (rank 1 = most preferred item) and individual covariates in the remaining columns. Missing positions are coded as NA. The variables are detailed below:

Classic Rank assigned to Classic.

Novel Rank assigned to Novel.

Thriller Rank assigned to Thriller.

Fantasy Rank assigned to Fantasy.

Biography Rank assigned to Biography.

Teenage Rank assigned to Teenage.

Horror Rank assigned to Horror.

Comics Rank assigned to Comics.

Poetry Rank assigned to Poetry.

Essay Rank assigned to Essay.

Humor Rank assigned to Humor.

Gender Gender.

Region Italian region of residence.

Age Age (years).

N_children Number of children.

Education Education level.

Final_mark Final grade of the education degree, scaled in the interval [6,10].

N_books Number of books read in the last 12 months.

ranks_sports	<i>Sports Data (complete rankings with covariates)</i>
--------------	--

Description

The Sports dataset was collected through an on-line questionnaire on sport preferences and habits administered within the 2016 Big Data Analytics in Sports (BDsports) project, developed by the Big and Open Data Innovation Laboratory (BODaI-Lab) of the University of Brescia. A sample of $N = 647$ respondents provided their complete rankings of $n = 8$ popular sports according to their personal preferences. The sports are: 1 = Soccer, 2 = Swimming, 3 = Volleyball, 4 = Cycling, 5 = Basket, 6 = Boxe and martial arts, 7 = Tennis and 8 = Jogging. The dataset also includes several covariates concerning respondents' socio-demographics characteristics and other sport-related information.

Usage

```
data(ranks_sports)
```

Format

A data frame gathering $N = 647$ complete rankings of the sports in the first $n = 8$ columns (rank 1 = most preferred item) and individual covariates in the remaining columns. The variables are detailed below:

Soccer Rank assigned to Soccer.

Swimming Rank assigned to Swimming.

Volleyball Rank assigned to Volleyball.

Cycling Rank assigned to Cycling.

Basket Rank assigned to Basket.

Boxe_and_martial_arts Rank assigned to Boxe and Martial Arts.

Tennis Rank assigned to Tennis.

Jogging Rank assigned to Jogging.

Gender Gender.

- Birth_month** Month of birth.
- Birth_year** Year of birth.
- Education** Education level.
- Residence** Geographical area of residence.
- Work** Type of work.
- Smoking** Smoking status.
- Sport_frequency** Number of times per week that the respondent plays sports.
- Sport_hours** Number of hours per week that the respondent watches sports.
- Sport_played** Sport played by the respondent.
- Personality** Main aspect of respondent's personality.
- Sport_motivation** Main reason why the respondent plays sport.
- Sport_type** Favorite sport type.
- Sport_relationships** Do you think that sport, especially in team games, allows you to make new friends?
- Water** Quantity of water consumed per day.
- Alcohol** Frequency of alcohol consumption.
- Fastfood** Frequency of fast food consumption.
- Food_supplements** Opinion about the use of food supplements in sports.
- Massmedia** Prevalent mass media used to inquire about sport.
- TV_space** Do you think that sport currently occupies the space it deserves on TV? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Magazine_space** Do you think that sport currently occupies the space it deserves on the magazines? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Radio_space** Do you think that sport currently occupies the space it deserves on the radio? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Internet_space** Do you think that sport currently occupies the space it deserves on internet? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Paid_channels** Do you think it is right that some sports are only accessible on paid channels? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Subscriptions** Any past or current subscription to a sport magazine/channel.
- Psychol_well_being** Do you think that practicing sports affects psychological well-being? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Physical_well_being** Do you think that practicing sports affects physical well-being? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Sport_nutrition** Do you think nutrition affects sport? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Overall_health** Do you think that practicing sports affects health? Rating from 1=definitely not to 7=definitely yes with 4=indifferent.
- Stress** Self-reported stress level on a scale between 0 and 100.
- Economic_status** Level of satisfaction for one's own economic status: 0=not at all, 1=a little bit, 2=enough, 3=satisfied, 4=a lot. It is the only covariate with some NA's.

rearrange_output_mix	<i>Arrange the output of MLE of mixtures of Mallows models with Spearman distance via EM algorithms</i>
----------------------	---

Description

Arrange the output of the object of class "emMSmix" according to a given relabelling of the mixture component labels.

Usage

```
rearrange_output_mix(output, ord)
```

Arguments

output	An object of class "emMSmix" returned by fitMSmix .
ord	Integer vector of length n_clust with the desired relabelling of the mixture component labels.

rMSmix	<i>Random samples from a mixture of Mallows models with Spearman distance</i>
--------	---

Description

Draw random samples of full rankings from a mixture of Mallows models with Spearman distance.

Usage

```
rMSmix(
  sample_size = 1,
  n_items,
  n_clust = 1,
  rho = NULL,
  theta = NULL,
  weights = NULL,
  uniform = FALSE,
  mh = TRUE
)
```

Arguments

<code>sample_size</code>	Number of full rankings to be sampled. Defaults to 1.
<code>n_items</code>	Number of items.
<code>n_clust</code>	Number of mixture components. Defaults to 1.
<code>rho</code>	Integer $G \times n$ matrix with the component-specific consensus rankings in each row. Defaults to NULL, meaning that the consensus rankings are randomly generated according to the sampling scheme indicated by the <code>uniform</code> argument. See Details.
<code>theta</code>	Numeric vector of G non-negative component-specific precision parameters. Defaults to NULL, meaning that the concentrations are uniformly generated from an interval containing typical values for the precisions. See Details.
<code>weights</code>	Numeric vector of G positive mixture weights (normalization is not necessary). Defaults to NULL, meaning that the mixture weights are randomly generated according to the sampling scheme indicated by the <code>uniform</code> argument. See Details.
<code>uniform</code>	Logical: whether <code>rho</code> or <code>weights</code> have to be sampled uniformly on their support. When <code>uniform = FALSE</code> they are sampled, respectively, to ensure separation among mixture components and populated weights. Used when $G > 1$ and either <code>rho</code> or <code>weights</code> are NULL (see Details). Defaults to FALSE.
<code>mh</code>	Logical: whether the samples must be drawn with the Metropolis-Hastings (MH) scheme implemented in the <code>BayesMallows</code> package, rather by direct sampling from the Mallows probability distribution. For <code>n_items > 10</code> , the MH is always applied to speed up the sampling procedure. Defaults to TRUE.

Details

When `n_items > 10` or `mh = TRUE`, the random samples are obtained by using the Metropolis-Hastings algorithm, described in Vitelli et al. (2018) and implemented in the `sample_mallows` function of the package `BayesMallows`.

When `theta = NULL`, the concentration parameters are randomly generated from a uniform distribution on the interval $(1/n^2, 3/n^{1.5})$ containing typical values for the precisions.

When `uniform = FALSE`, the mixing weights are sampled from a symmetric Dirichlet distribution with shape parameters all equal to $2G$, to favor populated and balanced clusters, and the consensus

parameters are sampled to favor well-separated clusters, i. e., at least at Spearman distance equal to $\frac{2}{G} \binom{n+1}{3}$ from each other.

Value

A list of the following named components:

samples	Integer $N \times n$ matrix with the sample_size simulated full rankings in each row.
rho	Integer $G \times n$ matrix with the component-specific consensus rankings used for the simulation in each row.
theta	Numeric vector of the G component-specific precision parameters used for the simulation.
weights	Numeric vector of the G mixture weights used for the simulation.
classification	Integer vector of the sample_size component membership labels.

Examples

```
## Example 1. Drawing from a mixture with randomly generated parameters of separated clusters.
set.seed(12345)
rMSmix(sample_size = 50, n_items = 25, n_clust = 5)
```

```
## Example 2. Drawing from a mixture with uniformly generated parameters.
set.seed(12345)
rMSmix(sample_size = 100, n_items = 9, n_clust = 3, uniform = TRUE)
```

```
## Example 3. Drawing from a mixture with customized parameters.
r_par <- rbind(1:5, c(4, 5, 2, 1, 3))
t_par <- c(0.01, 0.02)
w_par <- c(0.4, 0.6)
set.seed(12345)
rMSmix(sample_size = 50, n_items = 5, n_clust = 2, theta = t_par, rho = r_par, weights = w_par)
```

spear_dist	<i>Spearman distance</i>
------------	--------------------------

Description

Compute either the Spearman distance between each row of a full ranking matrix and a reference complete ranking, or the Spearman distance matrix between all pairs of full rankings.

Usage

```
spear_dist(
  rankings,
  rho = NULL,
  subset = NULL,
  diag = FALSE,
  upper = FALSE,
  plot_dist_mat = FALSE
)
```

Arguments

rankings	Integer $N \times n$ matrix or data frame with full rankings in each row.
rho	An optional full ranking whose Spearman distance from each row in rankings must be computed. Defaults to NULL, meaning that the Spearman distance matrix between all pairs of rows in rankings must be computed.
subset	Optional logical or integer vector specifying the subset of observations, i.e. rows of the rankings, to be kept. Missing values are taken as FALSE. Defaults to NULL meaning that all the rows are considered.
diag	Logical: whether the diagonal of the Spearman distance matrix must be returned. Used when rho = NULL. Defaults to FALSE.
upper	Logical: whether the upper triangle of the Spearman distance matrix must be printed. Used when rho = NULL. Defaults to FALSE.
plot_dist_mat	Logical: whether the Spearman distance matrix must be plotted. Used when rho = NULL. Defaults to FALSE.

Details

When rho = NULL, spear_dist recalls the `dist` function from the base package to compute the Spearman metric as squared Euclidian distance between all pairs of rows in rankings; otherwise, it recalls the `compute_rank_distance` routine of the BayesMallows package for the computation of the Spearman distance between each row in rankings and the full ranking rho.

Value

When rho = NULL, an object of class "dist" corresponding to the Spearman distance matrix; otherwise, a vector with the Spearman distances between each row in rankings and the full ranking rho.

[plot.dist](#)

Examples

```
## Example 1. Spearman distance between two full rankings.
spear_dist(rankings = c(4, 8, 6, 9, 2, 11, 3, 5, 1, 12, 7, 10), rho = 1:12)

## Example 2. Spearman distance between the Antifragility ranking dataset and the Borda ranking.
r_antifrag <- ranks_antifragility[, 1:7]
borda <- rank(data_description(rankings = r_antifrag)$mean_rank)
spear_dist(rankings = r_antifrag, rho = borda)

## Example 3. Spearman distance matrix of the Sports ranking dataset.
r_sports <- ranks_sports[, 1:8]
dist_mat <- spear_dist(rankings = r_sports)
dist_mat
# Spearman distance matrix for the subsample of females.
dist_f <- spear_dist(rankings = r_sports, subset = (ranks_sports$Gender == "Female"))
dist_f
```

spear_dist_distr	<i>Spearman distance distribution under the uniform ranking model</i>
------------------	---

Description

Provide (either the exact or the approximate) frequency distribution of the Spearman distance under the uniform (null) ranking model.

Usage

```
spear_dist_distr(n_items, log = TRUE)
```

Arguments

n_items	Number of items.
log	Logical: whether the frequencies must be reported on the log scale. Defaults to TRUE.

Details

When $n \leq 20$, the exact distribution provided by OEIS Foundation Inc. (2023) is returned by relying on a call to the `get_cardinalities` routine of the `BayesMallows` package. When $n > 20$, the approximate distribution introduced by Crispino et al. (2023) is returned. If $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

Value

A list of two named objects:

<code>distances</code>	All the possible Spearman distance values (i.e., the support of the distribution).
<code>logcard</code>	(Log)-frequencies corresponding to each value in <code>distances</code> .

Examples

```
## Example 1. Exact Spearman distance distribution for n=20 items.
distr <- spear_dist_distr(n_items = 20, log = FALSE)
plot(distr$distances, distr$logcard, type="l", ylab="Frequency", xlab="d",
main='Distribution of the Spearman distance\nunder the null model')
```

```
## Example 2. Approximate Spearman distance distribution for n=50 items with log-frequencies.
distr <- spear_dist_distr(n_items = 50)
plot(distr$distances, distr$logcard, type="l", ylab="Log-frequency", xlab="d",
main='Log-distribution of the Spearman distance\nunder the null model')
```

summary.emMSmix	<i>Summary of the fitted mixture of Mallows models with Spearman distance</i>
-----------------	---

Description

summary method for class "emMSmix".
 print method for class "summary.emMSmix".

Usage

```
## S3 method for class 'emMSmix'
summary(object, digits = 3, ...)

## S3 method for class 'summary.emMSmix'
print(x, ...)
```

Arguments

object	An object of class "emMSmix" returned by fitMSmix .
digits	Integer: decimal places for rounding the numerical summaries. Defaults to 3.
...	Further arguments passed to or from other methods (not used).
x	An object of class "summary.emMSmix" returned by summary.emMSmix .

Value

A list with the following named components:

modal_rankings	Integer matrix with the MLEs of the G component-specific consensus rankings in each row.
modal_orderings	Character matrix with the MLEs of the G component-specific consensus orderings in each row.
theta	Numeric vector of the MLEs of the G precisions.
weights	Numeric vector of the MLEs of the G mixture weights.
MAP_distr	Percentage distribution of the component memberships based on the MAP allocation. Returned when <code>n_clust > 1</code> , otherwise NULL
conv_perc	Percentage of convergence of the EM algorithm over the multiple starting points.
BIC	BIC value (based on full or augmented rankings).
BIC_part	BIC value (based on partial rankings).
call	The matched call.

Examples

```
## Example 1. Fit and summary of a 3-component mixture of Mallows models with Spearman distance
## for the Antifragility dataset.
r_antifrag <- ranks_antifragility[, 1:7]
set.seed(123)
mms_fit <- fitMSmix(rankings = r_antifrag, n_clust = 3, n_start = 10)
summary(mms_fit)
```

var_spear_dist	<i>Variance of the Spearman distance</i>
----------------	--

Description

Compute (either the exact or the approximate) (log-)variance of the Spearman distance under the Mallows model with Spearman distance.

Usage

```
var_spear_dist(theta, n_items, log = TRUE)
```

Arguments

theta	Non-negative precision parameter.
n_items	Number of items.
log	Logical: whether the expected Spearman distance on the log scale must be returned. Defaults to TRUE.

Details

When $n \leq 20$, the variance is exactly computed by relying on the Spearman distance distribution provided by OEIS Foundation Inc. (2023). When $n > 20$, it is approximated with the method introduced by Crispino et al. (2023) and, if $n > 170$, the approximation is also restricted over a fixed grid of values for the Spearman distance to limit computational burden.

The variance of the Spearman distance is independent of the consensus ranking of the Mallows model with Spearman distance due to the right-invariance of the metric. When $\theta = 0$, this is equal to $\frac{n^2(n-1)(n+1)^2}{36}$, which is the variance of the Spearman distance under the uniform (null) model.

Value

Either the exact or the approximate (log-)variance of the Spearman distance under the Mallows model with Spearman distance.
