

Package ‘MSwM’

July 21, 2025

Type Package

Title Fitting Markov Switching Models

Version 1.5

Date 2021-06-05

Author Josep A. Sanchez-Espigares, Alberto Lopez-Moreno

Maintainer Josep A. Sanchez-Espigares <josep.a.sanchez@upc.edu>

Description Estimation, inference and diagnostics for Univariate Autoregressive Markov Switching Models for Linear and Generalized Models. Distributions for the series include gaussian, Poisson, binomial and gamma cases. The EM algorithm is used for estimation (see Perlin (2012) <[doi:10.2139/ssrn.1714016](https://doi.org/10.2139/ssrn.1714016)>).

AIC-methods

Akaike Information Criterion for Markov Switching models.

Description

Calculates the Akaike information criterion for one Markov Switching model.

Usage

```
AIC(object, ..., k = 2)
```

Arguments

object	an object of class "MSM.lm" or "MSM.glm".
k	an optional numeric value for the penalty per parameter to be used. The default k=2 is the classical AIC.
...	currently not used.

Value

Returns a numeric value with the corresponding AIC (or BIC, or ..., depending on k).

energy	<i>Price of energy in Spain</i>
--------	---------------------------------

Description

Price of the energy in Spain with other economic data. Data from January 1, 2002 to October 31, 2008 (daily data, working days: Monday to Friday)

Usage

```
data(energy)
```

Format

A data frame with 1785 observations on the following 7 variables.

Price Average price of energy (Cent/kwh)

Oil Oil price (Euro/barril)

Gas Gas price (Euro/MWh)

Coal Coal price (Euro/T)

EurDol Exchange rate between Dolar-Euro (USD-Euro)

Ibex35 Ibex 35 index divided by one thousand

Demand Daily demand of energy (GWh)

Source

The data were obtained from the Spanish Market Operator of Energy (OMEL), the Bank of Spain and the U.S. Energy Information Administration

References

example	<i>Example data generated</i>
---------	-------------------------------

Description

The example data is a generated data set to show how `msmFit` can detect the presence of two regimes in a data with autocorrelative periods and other periods that are correlated with the covariate `x`.

Usage

```
data(example)
```

Format

A data frame with 300 observations on the following 2 variables.

`x` an uniform distribution with `min=0` and `max=1`.

`y` a variable generated through two models. For further information, see the vignette 'example' on this package.

Examples

```
data(example)
plot(x~y,data=example)

##See the vignette
#vignette("examples")
```

intervals-methods	<i>Function: Confidence Intervals on Coefficients</i>
-------------------	---

Description

Confidence intervals are obtained for the parameters associated with the model represented by the object.

Usage

```
intervals(object, level = 0.95, ...)
```

Arguments

<code>object</code>	a fitted Markov Switching model object from which parameter estimates can be extracted.
<code>level</code>	an optional numeric value for the interval confidence level. Defaults to 0.95.
<code>...</code>	currently not used.

Value

Print the coefficients with their intervals for each regime.

MSM.fitted-class	<i>Class "MSM.fitted"</i>
------------------	---------------------------

Description

MSM.fitted contains the values of fitting the EM algorithm for Markov Switching Models. It is an internal class and is stored in objects of class `MSM.lm` and `MSM.glm`

Slots

CondMean: Object of class "matrix", contains the conditional means for each state.
error: Object of class "matrix", are the conditional residuals of the model for each state.
Likel: Object of class "matrix", contains the likelihood of the parameters for each state.
margLik: Object of class "matrix", contains the marginal likelihood for each observation.
filtProb: Object of class "matrix", contains the filter probabilities for each state.
smoProb: Object of class "matrix", contains the smoothed probabilities for each state.
smoTransMat: Object of class "list", contains the smoothed transition probabilities in a "matrix" for each observation between all the states.
logLikel: Object of class "numeric", contains the global loglikelihood of the model.

Methods

[`signature(x = "MSM.fitted", i = "character", j = "missing", drop = "missing")`]: extract the components of the model.

Author(s)

Jose A. Sanchez-Espigares, Alberto Lopez-Moreno

MSM.glm-class

*Class "MSM.glm"***Description**

MSM.glm is an object containing Markov Switching model information for general linear models.

Objects from the Class

[msmFit](#) is an algorithm that builds a MSM.glm when the original model class is glm.

Slots

family: Object of class "ANY", contains the family of the object glm.
Likelihood: Object of class "function", is the function that allows calculation of the conditional density of the response.
model: Object of class "glm", contains the original model glm.
Coef: Object of class "data.frame", contains the coefficients of the model MSM where each row indicates the state.
seCoef: Object of class "data.frame", contains the standard errors of the coefficients.
transMat: Object of class "matrix", contains the transition probabilities of the states.
iniProb: Object of class "numeric", contains initial values of the parameters.
call: Object of class "call", contains the object call which msmFit has been executed.
k: Object of class "numeric", the numbers of states that the model has.
switch: Object of class "logical", contains which coefficients have switching.
Fit: Object of class "MSM.fitted", contains the values obtained for fitting an MSM model with EM algorithm.

Extends

Class "[MSM.linear](#)", directly. Class "[MSM](#)", by class "MSM.linear", distance 2.

Methods

[[signature](#)(x = "MSM.glm", i = "character", j = "missing", drop = "missing")]: extract the components of the model.

Author(s)

Jose A. Sanchez-Espigares, Alberto Lopez-Moreno

MSM.lm-class

Class "*MSM.lm*"

Description

MSM.lm is an object containing Markov Switching model information for linear models.

Objects from the Class

[msmFit](#) is an algorithm that builds a MSM.lm when the original model class is lm.

Slots

std: Object of class "numeric", contains the standard deviation for each state.
model: Object of class "glm", contains the original model glm
Coef: Object of class "data.frame", contains the coefficients of the model MSM, where each row indicates the state.
seCoef: Object of class "data.frame", contains the standard errors of the coefficients.
transMat: Object of class "matrix", contains the transition probabilities of the states.
iniProb: Object of class "numeric", contains initial values of the parameters.
call: Object of class "call", contains the object call which msmFit has been executed.
k: Object of class "numeric", the numbers of states that the model has.
switch: Object of class "logical", contains which coefficients have switching.
Fit: Object of class "MSM.fitted", contains the values obtained for fitting a MSM model with EM algorithm.

Extends

Class "[MSM.linear](#)", directly. Class "[MSM](#)", by class "MSM.linear", distance 2.

Methods

[[signature\(x = "MSM.lm", i = "character", j = "missing", drop = "missing"\)](#)]: extract the componentes of the model.

msmFit

Fitting Markov Switching Models

Description

msmFit is an implementation for modeling Markov Switching Models using the EM algorithm

Usage

```
msmFit(object, k, sw, p, data, family, control)
```

Arguments

object	an object of class "lm" or "glm", or "formula" with a symbolic description of the model to be fitted.
k	numeric, the estimated number of regimes that the model has.
sw	a logical vector indicatig which coefficients have switching.
p	integer, the number of AR coefficients that the MS model has to have. The default value is zero. If p is higher than zero, the last values of sw have to contain the AR coefficients which have switching.
data	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which "glm" is called.
family	a character value indicating what family belongs to the model. It is only required when the object is a "General linear formula".
control	a list of control parameters. See "Details".

Details

The control argument is a list that can supply any of the following components:

- trace: A logical value. If it is TRUE, tracing information on the progress of the optimization is produced.
- maxiter: The maximum number of iterations in the EM method. Default is 100.
- tol: Tolerance. The algorithm stops if it is unable to reduce the value by a factor of tol at a step. Default is 1e-8.
- maxiterOuter: The number of short runs of the EM method to establish the initial values. Default is 5
- maxiterInner: The number of iterations in the EM method in each short run to establish the initial values. Default is 10
- parallelization: A logical value. Whether the process is done by using parallelization or not. Default is TRUE.

Value

msm.fit returns an object of class `MSM.lm` or `MSM.glm`, depending on the input model.

msmResid*Extract Markov Switching Model Residuals*

Description

msmResid is a function which extracts model residuals from objects returned by Markov Switching modeling functions.

Usage

```
msmResid(object, regime)
```

Arguments

object	an object of class "MSM.lm" or "MSM.glm".
regime	a number or a vector indicating which regimes are selected to get its residuals. If is missing, the function calculates the conditional residuals of the model.

Value

A numeric vector with the pooled residuals or a matrix, when more than one regime is indicated, containing the residuals for each observation. When the attributed object is a glm, it returns the Pearson residuals.

plot-methods

Function: plot for Markov Switching Models

Description

Plot that shows the residuals for each regime with the conditional residuals.

Usage

```
plot(x, y, ...)
```

Arguments

x	an object of class "MSM.lm" or "MSM.glm".
y	currently not used.
...	currently not used.

Author(s)

Jose A. Sanchez-Espigares, Alberto Lopez-Moreno

 Plot : [plot](#), [plotProb](#), [plotReg](#), [plotDiag](#)

plotDiag

Plot Diagnostics for an msm Object

Description

Creates several plots for the residual analysis. It shows a plot of residuals against fitted values, a Normal Q-Q plot, ACF/PACF of residuals and ACF/PACF of square residuals. Depending on the selection, it shows the pooled residuals or the residuals for each regime.

Usage

```
plotDiag(x, regime, which)
```

Arguments

x	an object of class "MSM.lm" or "MSM.glm".
regime	a single numeric value or vector indicating the regimes to show its residuals. In order to show all the regimes, it could be written all.
which	if a subset of the plots is required, specify a subset of the numbers 1:3. The default value is c(1:3). See details for more information.

Details

The argument which has three values:

- 1: represents the plot of residuals against fitted values.
- 2: represents the Normal Q-Q plot.
- 3: represents the ACF/PACF of residuals and ACF/PACF of square residuals.

plotProb	<i>Plot of filtered and smoothed probabilities with regimes specifications.</i>
----------	---

Description

Creates one plot (or more, depending on the number of states) that contains, for each regime, its smoothed and filtered probabilities. Finally, it shows a plot for each regime with the response variable versus the smoothed probabilities, showing the periods where the variable is in that regime.

Usage

```
plotProb(x, which)
```

Arguments

x	an object of class "MSM.lm" or "MSM.glm".
which	if a subset of the plots is required, specify a subset of the numbers 1:(number of regimes +1). See details for more information.

Details

The argument which has options:

- 1: represents the plots that contains, for each regime, its smoothed and filtered probabilities..
- 2: (number of regimes +1): represents plot of the regime minus one with the response variable against the smoothed probabilities.

plotReg	<i>Comparative plots of response and explanatory variables with regime specifications.</i>
---------	--

Description

Creates a plot with the response and the explanatory variables with the smoothed probabilities of a specific regime.

Usage

```
plotReg(x, expl, regime = 1)
```

Arguments

x	an object of class "MSM.lm" or "MSM.glm".
expl	a character vector containing the names of the covariates of the model to show. If it is missing, all the variables are plotted.
regime	a numeric value indicating which regime has to be shown. By defect the value is 1.

summary-methods

Function: Summary for Markov Switching Models

Description

summary produces results summaries of the results of fitting Markov Switching Models.

Usage

```
## S4 method for signature 'MSM.lm'  
summary(object)  
## S4 method for signature 'MSM.glm'  
summary(object)
```

Arguments

object an object of class "MSM.lm" or "MSM.glm".

`traffic`

Traffic Deads in Spain

Description

The traffic data contains the daily number of deaths in traffic accidents in Spain during the year 2010, the average daily temperature and the daily sum of precipitations.

Usage

```
data(traffic)
```

Format

A data frame with 210 observations on the following 2 variables.

Date The date of each observation in format DD/MM/YYYY.

NDead The number of daily traffic deaths.

Temp The daily mean temperature in Spain (Celsius).

Prec The daily mean precipitation in Spain (l/m2).

Source

The data were obtained from the General Directorate of Traffic (Direccion General de Trafico) and the State Meteorological Agency of Spain (Agencia Estatal de Meteorologia de Espanya).

Examples

```
data=data(traffic)
ts.plot(traffic$NDead)
```

```
