

# Package ‘MachineShop’

July 21, 2025

**Type** Package

**Title** Machine Learning Models and Tools

**Version** 3.9.0

**Date** 2025-06-09

**Author** Brian J Smith [aut, cre]

**Maintainer** Brian J Smith <brian-j-smith@uiowa.edu>

**Description** Meta-package for statistical and machine learning with a unified interface for model fitting, prediction, performance assessment, and presentation of results. Approaches for model fitting and prediction of numerical, categorical, or censored time-to-event outcomes include traditional regression models, regularization methods, tree-based methods, support vector machines, neural networks, ensembles, data preprocessing, filtering, and model tuning and selection. Performance metrics are provided for model assessment and can be estimated with independent test sets, split sampling, cross-validation, or bootstrap resampling. Resample estimation can be executed in parallel for faster processing and nested in cases of model tuning and selection. Modeling results can be summarized with descriptive statistics; calibration curves; variable importance; partial dependence plots; confusion matrices; and ROC, lift, and other performance curves.

**Depends** R (>= 4.1.0)

**Imports** abind, cli (>= 3.1.0), dials (>= 0.0.4), foreach, ggplot2 (>= 3.4.0), kernlab, magrittr, Matrix (>= 1.5-0), methods, nnet, party, polyspline, progress, recipes (>= 1.0.0), rlang, rsample (>= 1.1.0), Rsolnp, survival, tibble, utils

**Suggests** adabag, BART, bartMachine, C50, censored, cluster, doParallel, e1071, earth, elasticnet, generics, gbm, glmnet, gridExtra, Hmisc, kableExtra, kknn, knitr, lars, MASS, mboost, mda, ParBayesianOptimization, parsnip (>= 1.1.0), partykit, pls, pso, randomForest, randomForestSRC, ranger, rBayesianOptimization, rmarkdown, rms, rpart, testthat, tree, xgboost

**LazyData** true

**License** GPL-3

**URL** <https://brian-j-smith.github.io/MachineShop/>

**BugReports** <https://github.com/brian-j-smith/MachineShop/issues>

**RoxygenNote** 7.3.2

MachineShop-package	<i>MachineShop: Machine Learning Models and Tools</i>
---------------------	---

---

**Description**

Meta-package for statistical and machine learning with a unified interface for model fitting, prediction, performance assessment, and presentation of results. Approaches for model fitting and prediction of numerical, categorical, or censored time-to-event outcomes include traditional regression models, regularization methods, tree-based methods, support vector machines, neural networks, ensembles, data preprocessing, filtering, and model tuning and selection. Performance metrics are provided for model assessment and can be estimated with independent test sets, split sampling, cross-validation, or bootstrap resampling. Resample estimation can be executed in parallel for faster processing and nested in cases of model tuning and selection. Modeling results can be summarized with descriptive statistics; calibration curves; variable importance; partial dependence plots; confusion matrices; and ROC, lift, and other performance curves.

**Details**

The following set of model fitting, prediction, and performance assessment functions are available for **MachineShop** models.

Training:

<code>fit</code>	Model fitting
<code>resample</code>	Resample estimation of model performance

Tuning Grids:

<code>expand_model</code>	Model expansion over tuning parameters
<code>expand_modelgrid</code>	Model tuning grid expansion
<code>expand_params</code>	Model parameters expansion
<code>expand_steps</code>	Recipe step parameters expansion

Response Values:

<code>response</code>	Observed
<code>predict</code>	Predicted

Performance Assessment:

<code>calibration</code>	Model calibration
<code>confusion</code>	Confusion matrix
<code>dependence</code>	Parital dependence

<code>diff</code>	Model performance differences
<code>lift</code>	Lift curves
<code>performance_metrics</code>	Model performance metrics
<code>performance_curve</code>	Model performance curves
<code>rfe</code>	Recursive feature elimination
<code>varimp</code>	Variable importance

Methods for resample estimation include

<code>BootControl</code>	Simple bootstrap
<code>BootOptimismControl</code>	Optimism-corrected bootstrap
<code>CVControl</code>	Repeated K-fold cross-validation
<code>CVOptimismControl</code>	Optimism-corrected cross-validation
<code>OOBControl</code>	Out-of-bootstrap
<code>SplitControl</code>	Split training-testing
<code>TrainControl</code>	Training resubstitution

Graphical and tabular summaries of modeling results can be obtained with

`plot`  
`print`  
`summary`

Further information on package features is available with

<code>metricinfo</code>	Performance metric information
<code>modelinfo</code>	Model information
<code>settings</code>	Global settings

Custom metrics and models can be created with the `MLMetric` and `MLModel` constructors.

## Description

Fits the Bagging algorithm proposed by Breiman in 1996 using classification trees as single classifiers.

## Usage

```
AdaBagModel(  
  mfinal = 100,  
  minsplit = 20,  
  minbucket = round(minsplit/3),  
  cp = 0.01,  
  maxcompete = 4,  
  maxsurrogate = 5,  
  usesurrogate = 2,  
  xval = 10,  
  surrogatestyle = 0,  
  maxdepth = 30  
)
```

## Arguments

mfinal	number of trees to use.
minsplit	minimum number of observations that must exist in a node in order for a split to be attempted.
minbucket	minimum number of observations in any terminal node.
cp	complexity parameter.
maxcompete	number of competitor splits retained in the output.
maxsurrogate	number of surrogate splits retained in the output.
usesurrogate	how to use surrogates in the splitting process.
xval	number of cross-validations.
surrogatestyle	controls the selection of a best surrogate.
maxdepth	maximum depth of any node of the final tree, with the root node counted as depth 0.

## Details

**Response types:** factor

**Automatic tuning of grid parameters:** mfinal, maxdepth

Further model details can be found in the source link below.

**Value**

MLModel class object.

**See Also**

[bagging](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package adabag to run

fit(Species ~ ., data = iris, model = AdaBagModel(mfinal = 5))
```

---

AdaBoostModel

*Boosting with Classification Trees*

---

**Description**

Fits the AdaBoost.M1 (Freund and Schapire, 1996) and SAMME (Zhu et al., 2009) algorithms using classification trees as single classifiers.

**Usage**

```
AdaBoostModel(
  boos = TRUE,
  mfinal = 100,
  coeflearn = c("Breiman", "Freund", "Zhu"),
  minsplit = 20,
  minbucket = round(minsplit/3),
  cp = 0.01,
  maxcompete = 4,
  maxsurrogate = 5,
  usesurrogate = 2,
  xval = 10,
  surrogatestyle = 0,
  maxdepth = 30
)
```

**Arguments**

<code>boos</code>	if TRUE, then bootstrap samples are drawn from the training set using the observation weights at each iteration. If FALSE, then all observations are used with their weights.
<code>mfinal</code>	number of iterations for which boosting is run.
<code>coeflearn</code>	learning algorithm.

minsplit	minimum number of observations that must exist in a node in order for a split to be attempted.
minbucket	minimum number of observations in any terminal node.
cp	complexity parameter.
maxcompete	number of competitor splits retained in the output.
maxsurrogate	number of surrogate splits retained in the output.
usesurrogate	how to use surrogates in the splitting process.
xval	number of cross-validations.
surrogatestyle	controls the selection of a best surrogate.
maxdepth	maximum depth of any node of the final tree, with the root node counted as depth 0.

## Details

**Response types:** factor

**Automatic tuning of grid parameters:** mfinal, maxdepth, coeflearn\*

\* excluded from grids by default

Further model details can be found in the source link below.

## Value

MLModel class object.

## See Also

[boosting](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package adabag to run
fit(Species ~ ., data = iris, model = AdaBoostModel(mfinal = 5))
```

---

as.data.frame

*Coerce to a Data Frame*

---

## Description

Functions to coerce objects to data frames.

**Usage**

```
## S3 method for class 'ModelFrame'
as.data.frame(x, ...)

## S3 method for class 'Resample'
as.data.frame(x, ...)

## S3 method for class 'TabularArray'
as.data.frame(x, ...)
```

**Arguments**

x                    [ModelFrame](#), [resample](#) results, resampled [performance](#) estimates, model performance [differences](#), or [t-test](#) comparisons of the differences.

...                  arguments passed to other methods.

**Value**

data.frame class object.

---

as.MLInput

*Coerce to an MLInput*

---

**Description**

Function to coerce an object to MLInput.

**Usage**

```
as.MLInput(x, ...)

## S3 method for class 'MLModelFit'
as.MLInput(x, ...)

## S3 method for class 'ModelSpecification'
as.MLInput(x, ...)
```

**Arguments**

x                    model [fit](#) result or **MachineShop** [model specification](#).

...                  arguments passed to other methods.

**Value**

MLInput class object.

---

as.MLModel	<i>Coerce to an MLModel</i>
------------	-----------------------------

---

## Description

Function to coerce an object to MLModel.

## Usage

```
as.MLModel(x, ...)
```

```
## S3 method for class 'MLModelFit'
```

```
as.MLModel(x, ...)
```

```
## S3 method for class 'ModelSpecification'
```

```
as.MLModel(x, ...)
```

```
## S3 method for class 'model_spec'
```

```
as.MLModel(x, ...)
```

## Arguments

x	model <a href="#">fit</a> result, <b>MachineShop</b> <a href="#">model specification</a> , or <b>parsnip</b> <a href="#">model specification</a> .
...	arguments passed to other methods.

## Value

MLModel class object.

## See Also

[ParsnipModel](#)

---

BARTMachineModel	<i>Bayesian Additive Regression Trees Model</i>
------------------	---

---

## Description

Builds a BART model for regression or classification.

**Usage**

```

BARTMachineModel(
  num_trees = 50,
  num_burn = 250,
  num_iter = 1000,
  alpha = 0.95,
  beta = 2,
  k = 2,
  q = 0.9,
  nu = 3,
  mh_prob_steps = c(2.5, 2.5, 4)/9,
  verbose = FALSE,
  ...
)

```

**Arguments**

num_trees	number of trees to be grown in the sum-of-trees model.
num_burn	number of MCMC samples to be discarded as "burn-in".
num_iter	number of MCMC samples to draw from the posterior distribution.
alpha, beta	base and power hyperparameters in tree prior for whether a node is nonterminal or not.
k	regression prior probability that $E(Y X)$ is contained in the interval $(y_{min}, y_{max})$ , based on a normal distribution.
q	quantile of the prior on the error variance at which the data-based estimate is placed.
nu	regression degrees of freedom for the inverse $\sigma^2$ prior.
mh_prob_steps	vector of prior probabilities for proposing changes to the tree structures: (GROW, PRUNE, CHANGE).
verbose	logical indicating whether to print progress information about the algorithm.
...	additional arguments to <a href="#">bartMachine</a> .

**Details**

**Response types:** binary factor, numeric

**Automatic tuning of grid parameters:** alpha, beta, k, nu

Further model details can be found in the source link below.

In calls to [varimp](#) for BARTMachineModel, argument type may be specified as "splits" (default) for the proportion of time each predictor is chosen for a splitting rule or as "trees" for the proportion of times each predictor appears in a tree. Argument num\_replicates is also available to control the number of BART replicates used in estimating the inclusion proportions [default: 5]. Variable importance is automatically scaled to range from 0 to 100. To obtain unscaled importance values, set scale = FALSE. See example below.

**Value**

MLModel class object.

**See Also**

[bartMachine](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package bartMachine to run

model_fit <- fit(sale_amount ~ ., data = ICHomes, model = BARTMachineModel)
varimp(model_fit, method = "model", type = "splits", num_replicates = 20,
        scale = FALSE)
```

---

BARTModel

*Bayesian Additive Regression Trees Model*

---

**Description**

Flexible nonparametric modeling of covariates for continuous, binary, categorical and time-to-event outcomes.

**Usage**

```
BARTModel(
  K = integer(),
  sparse = FALSE,
  theta = 0,
  omega = 1,
  a = 0.5,
  b = 1,
  rho = numeric(),
  augment = FALSE,
  xinfo = matrix(NA, 0, 0),
  usequants = FALSE,
  sigest = NA,
  sigdf = 3,
  sigquant = 0.9,
  lambda = NA,
  k = 2,
  power = 2,
  base = 0.95,
  tau.num = numeric(),
  offset = numeric(),
```

```

ntree = integer(),
numcut = 100,
ndpost = 1000,
nskip = integer(),
keepevery = integer(),
printevery = 1000
)

```

## Arguments

K	if provided, then coarsen the times of survival responses per the quantiles $1/K, 2/K, \dots, K/K$ to reduce computational burdern.
sparse	logical indicating whether to perform variable selection based on a sparse Dirichlet prior rather than simply uniform; see Linero 2016.
theta, omega	<i>theta</i> and <i>omega</i> parameters; zero means random.
a, b	sparse parameters for $Beta(a, b)$ prior: $0.5 \leq a \leq 1$ where lower values induce more sparsity and typically $b = 1$ .
rho	sparse parameter: typically $\rho = p$ where $p$ is the number of covariates under consideration.
augment	whether data augmentation is to be performed in sparse variable selection.
xinfo	optional matrix whose rows are the covariates and columns their cutpoints.
usequants	whether covariate cutpoints are defined by uniform quantiles or generated uniformly.
sigest	normal error variance prior for numeric response variables.
sigdf	degrees of freedom for error variance prior.
sigquant	quantile at which a rough estimate of the error standard deviation is placed.
lambda	scale of the prior error variance.
k	number of standard deviations $f(x)$ is away from $\pm 3$ for categorical response variables.
power, base	power and base parameters for tree prior.
tau.num	numerator in the <i>tau</i> definition, i.e., $\tau = \tau.\text{num} / (k * \sqrt{\text{ntree}})$ .
offset	override for the default <i>offset</i> of $F^{-1}(\text{mean}(y))$ in the multivariate response probability $P(y[j] = 1 x) = F(f(x)[j] + \text{offset}[j])$ .
ntree	number of trees in the sum.
numcut	number of possible covariate cutoff values.
ndpost	number of posterior draws returned.
nskip	number of MCMC iterations to be treated as burn in.
keepevery	interval at which to keep posterior draws.
printevery	interval at which to print MCMC progress.

## Details

**Response types:** factor, numeric, Surv

Default argument values and further model details can be found in the source See Also links below.

**Value**

MLModel class object.

**See Also**

[gbart](#), [mbart](#), [surv.bart](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package BART to run

fit(sale_amount ~ ., data = ICHomes, model = BARTModel)
```

---

BlackBoostModel

*Gradient Boosting with Regression Trees*

---

**Description**

Gradient boosting for optimizing arbitrary loss functions where regression trees are utilized as base-learners.

**Usage**

```
BlackBoostModel(
  family = NULL,
  mstop = 100,
  nu = 0.1,
  risk = c("inbag", "oobag", "none"),
  stopintern = FALSE,
  trace = FALSE,
  teststat = c("quadratic", "maximum"),
  testtype = c("Teststatistic", "Univariate", "Bonferroni", "MonteCarlo"),
  mincriterion = 0,
  minsplit = 10,
  minbucket = 4,
  maxdepth = 2,
  saveinfo = FALSE,
  ...
)
```

**Arguments**

family	optional <a href="#">Family</a> object. Set automatically according to the class type of the response variable.
mstop	number of initial boosting iterations.

<code>nu</code>	step size or shrinkage parameter between 0 and 1.
<code>risk</code>	method to use in computing the empirical risk for each boosting iteration.
<code>stopintern</code>	logical indicating whether the boosting algorithm stops internally when the out-of-bag risk increases at a subsequent iteration.
<code>trace</code>	logical indicating whether status information is printed during the fitting process.
<code>teststat</code>	type of the test statistic to be applied for variable selection.
<code>testtype</code>	how to compute the distribution of the test statistic.
<code>mincriterion</code>	value of the test statistic or 1 - p-value that must be exceeded in order to implement a split.
<code>minsplit</code>	minimum sum of weights in a node in order to be considered for splitting.
<code>minbucket</code>	minimum sum of weights in a terminal node.
<code>maxdepth</code>	maximum depth of the tree.
<code>saveinfo</code>	logical indicating whether to store information about variable selection in info slot of each partynode.
<code>...</code>	additional arguments to <code>ctree_control</code> .

## Details

**Response types:** binary factor, BinomialVariate, NegBinomialVariate, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameters:** `mstop`, `maxdepth`

Default argument values and further model details can be found in the source See Also links below.

## Value

MModel class object.

## See Also

[blackboost](#), [Family](#), [ctree\\_control](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested packages mboost and partykit to run

data(Pima.tr, package = "MASS")

fit(type ~ ., data = Pima.tr, model = BlackBoostModel)
```

**Description**

Fit classification tree models or rule-based models using Quinlan's C5.0 algorithm.

**Usage**

```
C50Model(
  trials = 1,
  rules = FALSE,
  subset = TRUE,
  bands = 0,
  winnow = FALSE,
  noGlobalPruning = FALSE,
  CF = 0.25,
  minCases = 2,
  fuzzyThreshold = FALSE,
  sample = 0,
  earlyStopping = TRUE
)
```

**Arguments**

trials	integer number of boosting iterations.
rules	logical indicating whether to decompose the tree into a rule-based model.
subset	logical indicating whether the model should evaluate groups of discrete predictors for splits.
bands	integer between 2 and 1000 specifying a number of bands into which to group rules ordered by their affect on the error rate.
winnow	logical indicating use of predictor winnowing (i.e. feature selection).
noGlobalPruning	logical indicating a final, global pruning step to simplify the tree.
CF	number in (0, 1) for the confidence factor.
minCases	integer for the smallest number of samples that must be put in at least two of the splits.
fuzzyThreshold	logical indicating whether to evaluate possible advanced splits of the data.
sample	value between (0, 0.999) that specifies the random proportion of data to use in training the model.
earlyStopping	logical indicating whether the internal method for stopping boosting should be used.

## Details

**Response types:** factor

**Automatic tuning of grid parameters:** trials, rules, winnow

Latter arguments are passed to [C5.0Control](#). Further model details can be found in the source link below.

In calls to [varimp](#) for `C50Model`, argument type may be specified as "usage" (default) for the percentage of training set samples that fall into all terminal nodes after the split of each predictor or as "splits" for the percentage of splits associated with each predictor. Variable importance is automatically scaled to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`. See example below.

## Value

MLModel class object.

## See Also

[C5.0](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package C50 to run

model_fit <- fit(Species ~ ., data = iris, model = C50Model)
varimp(model_fit, method = "model", type = "splits", scale = FALSE)
```

---

calibration

*Model Calibration*

---

## Description

Calculate calibration estimates from observed and predicted responses.

## Usage

```
calibration(
  x,
  y = NULL,
  weights = NULL,
  breaks = 10,
  span = 0.75,
  distr = character(),
  pool = FALSE,
  na.rm = TRUE,
  ...
)
```

**Arguments**

<code>x</code>	<a href="#">observed responses</a> or <a href="#">resample</a> result containing observed and predicted responses.
<code>y</code>	<a href="#">predicted responses</a> if not contained in <code>x</code> .
<code>weights</code>	numeric vector of non-negative <a href="#">case weights</a> for the observed <code>x</code> responses [default: equal weights].
<code>breaks</code>	value defining the response variable bins within which to calculate observed mean values. May be specified as a number of bins, a vector of breakpoints, or NULL to fit smooth curves with splines for predicted survival probabilities and with <a href="#">loess</a> for others.
<code>span</code>	numeric parameter controlling the degree of loess smoothing.
<code>distr</code>	character string specifying a distribution with which to estimate the observed survival mean. Possible values are "empirical" for the Kaplan-Meier estimator, "exponential", "extreme", "gaussian", "loggaussian", "logistic", "loglogistic", "lognormal", "rayleigh", "t", or "weibull". Defaults to the distribution that was used in predicting mean survival times.
<code>pool</code>	logical indicating whether to compute a single calibration curve on predictions pooled over all resampling iterations or to compute them for each iteration individually and return the mean calibration curve. Pooling can result in large memory allocation errors when fitting smooth curves with <code>breaks = NULL</code> . The current default is changed from versions $\leq 3.8.0$ of the package which only implemented <code>pool = TRUE</code> .
<code>na.rm</code>	logical indicating whether to remove observed or predicted responses that are NA when calculating metrics.
<code>...</code>	arguments passed to other methods.

**Value**

Calibration class object that inherits from `data.frame`.

**See Also**

[c](#), [plot](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

library(survival)

control <- CVControl() %>% set_predict(times = c(90, 180, 360))
res <- resample(Surv(time, status) ~ ., data = veteran, model = GBMModel,
               control = control)
cal <- calibration(res)
plot(cal)
```

---

case_weights	<i>Extract Case Weights</i>
--------------	-----------------------------

---

## Description

Extract the case weights from an object.

## Usage

```
case_weights(object, newdata = NULL)
```

## Arguments

object	model <a href="#">fit</a> result, <a href="#">ModelFrame</a> , or <a href="#">recipe</a> .
newdata	dataset from which to extract the weights if given; otherwise, object is used. The dataset should be given as a <a href="#">ModelFrame</a> or as a <a href="#">data frame</a> if object contains a <a href="#">ModelFrame</a> or a <a href="#">recipe</a> , respectively.

## Examples

```
## Training and test sets
inds <- sample(nrow(ICHomes), nrow(ICHomes) * 2 / 3)
trainset <- ICHomes[inds, ]
testset <- ICHomes[-inds, ]

## ModelFrame case weights
trainmf <- ModelFrame(sale_amount ~ . - built, data = trainset, weights = built)
testmf <- ModelFrame(formula(trainmf), data = testset, weights = built)
mf_fit <- fit(trainmf, model = GLMModel)
rmse(response(mf_fit, testmf), predict(mf_fit, testmf),
      case_weights(mf_fit, testmf))

## Recipe case weights
library(recipes)
rec <- recipe(sale_amount ~ ., data = trainset) %>%
  role_case(weight = built, replace = TRUE)
rec_fit <- fit(rec, model = GLMModel)
rmse(response(rec_fit, testset), predict(rec_fit, testset),
      case_weights(rec_fit, testset))
```

---

CForestModel

Conditional Random Forest Model

---

## Description

An implementation of the random forest and bagging ensemble algorithms utilizing conditional inference trees as base learners.

## Usage

```
CForestModel(
  teststat = c("quad", "max"),
  testtype = c("Univariate", "Teststatistic", "Bonferroni", "MonteCarlo"),
  mincriterion = 0,
  ntree = 500,
  mtry = 5,
  replace = TRUE,
  fraction = 0.632
)
```

## Arguments

teststat	character specifying the type of the test statistic to be applied.
testtype	character specifying how to compute the distribution of the test statistic.
mincriterion	value of the test statistic that must be exceeded in order to implement a split.
ntree	number of trees to grow in a forest.
mtry	number of input variables randomly sampled as candidates at each node for random forest like algorithms.
replace	logical indicating whether sampling of observations is done with or without replacement.
fraction	fraction of number of observations to draw without replacement (only relevant if replace = FALSE).

## Details

**Response types:** factor, numeric, Surv

**Automatic tuning of grid parameter:** mtry

Supplied arguments are passed to [cforest\\_control](#). Further model details can be found in the source link below.

## Value

MLModel class object.

**See Also**

[cforest](#), [fit](#), [resample](#)

**Examples**

```
fit(sale_amount ~ ., data = ICHomes, model = CForestModel)
```

---

combine

*Combine MachineShop Objects*

---

**Description**

Combine one or more **MachineShop** objects of the same class.

**Usage**

```
## S3 method for class 'Calibration'
c(...)

## S3 method for class 'ConfusionList'
c(...)

## S3 method for class 'ConfusionMatrix'
c(...)

## S3 method for class 'LiftCurve'
c(...)

## S3 method for class 'ListOf'
c(...)

## S3 method for class 'PerformanceCurve'
c(...)

## S3 method for class 'Resample'
c(...)

## S4 method for signature 'SurvMatrix, SurvMatrix'
e1 + e2
```

**Arguments**

...            named or unnamed [calibration](#), [confusion](#), [lift](#), [performance curve](#), [summary](#), or [resample](#) results. Curves must have been generated with the same performance [metrics](#) and resamples with the same resampling [control](#).

e1, e2        objects.

**Value**

Object of the same class as the arguments.

---

confusion	<i>Confusion Matrix</i>
-----------	-------------------------

---

**Description**

Calculate confusion matrices of predicted and observed responses.

**Usage**

```
confusion(
  x,
  y = NULL,
  weights = NULL,
  cutoff = MachineShop::settings("cutoff"),
  na.rm = TRUE,
  ...
)
```

```
ConfusionMatrix(data = NA, ordered = FALSE)
```

**Arguments**

x	factor of <a href="#">observed responses</a> or <a href="#">resample</a> result containing observed and predicted responses.
y	<a href="#">predicted responses</a> if not contained in x.
weights	numeric vector of non-negative <a href="#">case weights</a> for the observed x responses [default: equal weights].
cutoff	numeric (0, 1) threshold above which binary factor probabilities are classified as events and below which survival probabilities are classified. If NULL, then factor responses are summed directly over predicted class probabilities, whereas a default cutoff of 0.5 is used for survival probabilities. Class probability summations and survival will appear as decimal numbers that can be interpreted as expected counts.
na.rm	logical indicating whether to remove observed or predicted responses that are NA when calculating metrics.
...	arguments passed to other methods.
data	square matrix, or object that can be converted to one, of cross-classified predicted and observed values in the rows and columns, respectively.
ordered	logical indicating whether the confusion matrix row and columns should be regarded as ordered.

**Value**

The return value is a `ConfusionMatrix` class object that inherits from `table` if `x` and `y` responses are specified or a `ConfusionList` object that inherits from `list` if `x` is a `Resample` object.

**See Also**

[c](#), [plot](#), [summary](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

res <- resample(Species ~ ., data = iris, model = GBMModel)
(conf <- confusion(res))
plot(conf)
```

---

CoxModel

*Proportional Hazards Regression Model*

---

**Description**

Fits a Cox proportional hazards regression model. Time dependent variables, time dependent strata, multiple events per subject, and other extensions are incorporated using the counting process formulation of Andersen and Gill.

**Usage**

```
CoxModel(ties = c("efron", "breslow", "exact"), ...)

CoxStepAICModel(
  ties = c("efron", "breslow", "exact"),
  ...,
  direction = c("both", "backward", "forward"),
  scope = list(),
  k = 2,
  trace = FALSE,
  steps = 1000
)
```

**Arguments**

<code>ties</code>	character string specifying the method for tie handling.
<code>...</code>	arguments passed to <a href="#">coxph.control</a> .
<code>direction</code>	mode of stepwise search, can be one of "both" (default), "backward", or "forward".

scope	defines the range of models examined in the stepwise search. This should be a list containing components upper and lower, both formulae.
k	multiple of the number of degrees of freedom used for the penalty. Only $k = 2$ gives the genuine AIC; $k = .(\log(\text{nobs}))$ is sometimes referred to as BIC or SBC.
trace	if positive, information is printed during the running of stepAIC. Larger values may give more information on the fitting process.
steps	maximum number of steps to be considered.

Details

**Response types:** Surv

Default argument values and further model details can be found in the source See Also links below.

In calls to [varimp](#) for CoxModel and CoxStepAICModel, numeric argument base may be specified for the (negative) logarithmic transformation of p-values [default: `exp(1)`]. Transformed p-values are automatically scaled in the calculation of variable importance to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`.

Value

MLModel class object.

See Also

[coxph](#), [coxph.control](#), [stepAIC](#), [fit](#), [resample](#)

Examples

```
library(survival)

fit(Surv(time, status) ~ ., data = veteran, model = CoxModel)
```

---

dependence	<i>Partial Dependence</i>
------------	---------------------------

---

Description

Calculate partial dependence of a response on select predictor variables.

**Usage**

```
dependence(
  object,
  data = NULL,
  select = NULL,
  interaction = FALSE,
  n = 10,
  intervals = c("uniform", "quantile"),
  distr = character(),
  method = character(),
  stats = MachineShop::settings("stats.PartialDependence"),
  na.rm = TRUE
)
```

**Arguments**

<code>object</code>	model <a href="#">fit</a> result.
<code>data</code>	<a href="#">data frame</a> containing all predictor variables. If not specified, the training data will be used by default.
<code>select</code>	expression indicating predictor variables for which to compute partial dependence (see <a href="#">subset</a> for syntax) [default: all].
<code>interaction</code>	logical indicating whether to calculate dependence on the interacted predictors.
<code>n</code>	number of predictor values at which to perform calculations.
<code>intervals</code>	character string specifying whether the <code>n</code> values are spaced uniformly ("uniform") or according to variable quantiles ("quantile").
<code>distr, method</code>	arguments passed to <a href="#">predict</a> .
<code>stats</code>	function, function name, or vector of these with which to compute response variable summary statistics over non-selected predictor variables.
<code>na.rm</code>	logical indicating whether to exclude missing predicted response values from the calculation of summary statistics.

**Value**

PartialDependence class object that inherits from `data.frame`.

**See Also**

[plot](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

gbm_fit <- fit(Species ~ ., data = iris, model = GBMModel)
(pd <- dependence(gbm_fit, select = c(Petal.Length, Petal.Width)))
plot(pd)
```

## Description

Pairwise model differences in resampled performance metrics.

## Usage

```
## S3 method for class 'MLModel'
diff(x, ...)

## S3 method for class 'Performance'
diff(x, ...)

## S3 method for class 'Resample'
diff(x, ...)
```

## Arguments

x	model <a href="#">performance</a> or <a href="#">resample</a> result.
...	arguments passed to other methods.

## Value

PerformanceDiff class object that inherits from Performance.

## See Also

[t.test](#), [plot](#), [summary](#)

## Examples

```
## Requires prior installation of suggested package gbm to run

## Survival response example
library(survival)

fo <- Surv(time, status) ~ .
control <- CVControl()

gbm_res1 <- resample(fo, data = veteran, GBMModel(n.trees = 25), control)
gbm_res2 <- resample(fo, data = veteran, GBMModel(n.trees = 50), control)
gbm_res3 <- resample(fo, data = veteran, GBMModel(n.trees = 100), control)

res <- c(GBM1 = gbm_res1, GBM2 = gbm_res2, GBM3 = gbm_res3)
res_diff <- diff(res)
summary(res_diff)
```

```
plot(res_diff)
```

---

**DiscreteVariate***Discrete Variate Constructors*

---

**Description**

Create a variate of binomial counts, discrete numbers, negative binomial counts, or Poisson counts.

**Usage**

```
BinomialVariate(x = integer(), size = integer())
```

```
DiscreteVariate(x = integer(), min = -Inf, max = Inf)
```

```
NegBinomialVariate(x = integer())
```

```
PoissonVariate(x = integer())
```

**Arguments**

x	numeric vector.
size	number or numeric vector of binomial trials.
min, max	minimum and maximum bounds for discrete numbers.

**Value**

BinomialVariate object class, DiscreteVariate that inherits from numeric, or NegBinomialVariate or PoissonVariate that inherit from DiscreteVariate.

**See Also**

[role\\_binom](#)

**Examples**

```
BinomialVariate(rbinom(25, 10, 0.5), size = 10)  
PoissonVariate(rpois(25, 10))
```

EarthModel

*Multivariate Adaptive Regression Splines Model***Description**

Build a regression model using the techniques in Friedman's papers "Multivariate Adaptive Regression Splines" and "Fast MARS".

**Usage**

```
EarthModel(
  pmethod = c("backward", "none", "exhaustive", "forward", "seqrep", "cv"),
  trace = 0,
  degree = 1,
  nprune = integer(),
  nfold = 0,
  ncross = 1,
  stratify = TRUE
)
```

**Arguments**

pmethod	pruning method.
trace	level of execution information to display.
degree	maximum degree of interaction.
nprune	maximum number of terms (including intercept) in the pruned model.
nfold	number of cross-validation folds.
ncross	number of cross-validations if nfold > 1.
stratify	logical indicating whether to stratify cross-validation samples by the response levels.

**Details**

**Response types:** factor, numeric

**Automatic tuning of grid parameters:** nprune, degree\*

\* excluded from grids by default

Default argument values and further model details can be found in the source See Also link below.

In calls to `varimp` for `EarthModel`, argument type may be specified as "nsubsets" (default) for the number of model subsets that include each predictor, as "gcv" for the generalized cross-validation decrease over all subsets that include each predictor, or as "rss" for the residual sums of squares decrease. Variable importance is automatically scaled to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`. See example below.

**Value**

MLModel class object.

**See Also**

[earth](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package earth to run

model_fit <- fit(Species ~ ., data = iris, model = EarthModel)
varimp(model_fit, method = "model", type = "gcv", scale = FALSE)
```

---

expand_model	<i>Model Expansion Over Tuning Parameters</i>
--------------	---

---

**Description**

Expand a model over all combinations of a grid of tuning parameters.

**Usage**

```
expand_model(object, ..., random = FALSE)
```

**Arguments**

- |        |   |
|--------|---|
| object | <a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model. |
| ...    | named vectors or factors or a list of these containing the parameter values over which to expand object.                    |
| random | number of points to be randomly sampled from the parameter grid or FALSE if all points are to be returned.                  |

**Value**

list of expanded models.

**See Also**

[SelectedModel](#)

## Examples

```
## Requires prior installation of suggested package gbm to run

data(Boston, package = "MASS")

models <- expand_model(GBMModel, n.trees = c(50, 100),
                      interaction.depth = 1:2)

fit(medv ~ ., data = Boston, model = SelectedModel(models))
```

---

expand_modelgrid	<i>Model Tuning Grid Expansion</i>
------------------	------------------------------------

---

## Description

Expand a model grid of tuning parameter values.

## Usage

```
expand_modelgrid(...)

## S3 method for class 'formula'
expand_modelgrid(formula, data, model, info = FALSE, ...)

## S3 method for class 'matrix'
expand_modelgrid(x, y, model, info = FALSE, ...)

## S3 method for class 'ModelFrame'
expand_modelgrid(input, model, info = FALSE, ...)

## S3 method for class 'recipe'
expand_modelgrid(input, model, info = FALSE, ...)

## S3 method for class 'ModelSpecification'
expand_modelgrid(object, ...)

## S3 method for class 'MLModel'
expand_modelgrid(model, ...)

## S3 method for class 'MLModelFunction'
expand_modelgrid(model, ...)
```

## Arguments

...	arguments passed from the generic function to its methods and from the <code>MLModel</code> and <code>MLModelFunction</code> methods to others. The first argument of each <code>expand_modelgrid</code> method is positional and, as such, must be given first in calls to them.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them.
model	<a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model. A model can be given first followed by any of the variable specifications.
info	logical indicating whether to return model-defined grid construction information rather than the grid values.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.
input	<a href="#">input</a> object defining and containing the model predictor and response variables.
object	model <a href="#">specification</a> .

## Details

The `expand_modelgrid` function enables manual extraction and viewing of grids created automatically when a [TunedModel](#) is fit.

## Value

A data frame of parameter values or NULL if data are required for construction of the grid but not supplied.

## See Also

[TunedModel](#)

## Examples

```
expand_modelgrid(TunedModel(GBMModel, grid = 5))

## Requires prior installation of suggested package glmnet to run
expand_modelgrid(TunedModel(GLMNetModel, grid = c(alpha = 5, lambda = 10)),
  sale_amount ~ ., data = ICHomes)

gbm_grid <- ParameterGrid(
  n.trees = dials::trees(),
  interaction.depth = dials::tree_depth(),
  size = 5
)
expand_modelgrid(TunedModel(GBMModel, grid = gbm_grid))

rf_grid <- ParameterGrid(
  mtry = dials::mtry(),
```

```

      nodesize = dials::max_nodes(),
      size = c(3, 5)
    )
  expand_modelgrid(TunedModel(RandomForestModel, grid = rf_grid),
    sale_amount ~ ., data = ICHomes)

```

---

expand\_params

*Model Parameters Expansion*

---

## Description

Create a grid of parameter values from all combinations of supplied inputs.

## Usage

```
expand_params(..., random = FALSE)
```

## Arguments

...	named data frames or vectors or a list of these containing the parameter values over which to create the grid.
random	number of points to be randomly sampled from the parameter grid or FALSE if all points are to be returned.

## Value

A data frame containing one row for each combination of the supplied inputs.

## See Also

[TunedModel](#)

## Examples

```

## Requires prior installation of suggested package gbm to run

data(Boston, package = "MASS")

grid <- expand_params(
  n.trees = c(50, 100),
  interaction.depth = 1:2
)

fit(medv ~ ., data = Boston, model = TunedModel(GBMModel, grid = grid))

```

---

expand\_steps

*Recipe Step Parameters Expansion*

---

## Description

Create a grid of parameter values from all combinations of lists supplied for steps of a preprocessing recipe.

## Usage

```
expand_steps(..., random = FALSE)
```

## Arguments

<code>...</code>	one or more lists containing parameter values over which to create the grid. For each list an argument name should be given as the <code>id</code> of the <a href="#">recipe</a> step to which it corresponds.
<code>random</code>	number of points to be randomly sampled from the parameter grid or <code>FALSE</code> if all points are to be returned.

## Value

RecipeGrid class object that inherits from `data.frame`.

## See Also

[TunedInput](#)

## Examples

```
library(recipes)
data(Boston, package = "MASS")

rec <- recipe(medv ~ ., data = Boston) %>%
  step_corr(all_numeric_predictors(), id = "corr") %>%
  step_pca(all_numeric_predictors(), id = "pca")

expand_steps(
  corr = list(threshold = c(0.8, 0.9),
             method = c("pearson", "spearman")),
  pca = list(num_comp = 1:3)
)
```

---

extract	<i>Extract Elements of an Object</i>
---------	--------------------------------------

---

**Description**

Operators acting on data structures to extract elements.

**Usage**

```
## S3 method for class 'BinomialVariate'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'DiscreteVariate,ANY,missing,missing'
x[i]

## S4 method for signature 'ListOf,ANY,missing,missing'
x[i]

## S4 method for signature 'ModelFrame,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'ModelFrame,ANY,missing,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'ModelFrame,missing,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'ModelFrame,missing,missing,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'RecipeGrid,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'Resample,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'Resample,ANY,missing,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'Resample,missing,missing,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'SurvMatrix,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'SurvTimes,ANY,missing,missing'
x[i]
```

**Arguments**

<code>x</code>	object from which to extract elements.
<code>i, j, ...</code>	indices specifying elements to extract.
<code>drop</code>	logical indicating that the result be returned as an object coerced to the lowest dimension possible if TRUE or with the original dimensions and class otherwise.

FDAModel

*Flexible and Penalized Discriminant Analysis Models***Description**

Performs flexible discriminant analysis.

**Usage**

```
FDAModel(
  theta = matrix(NA, 0, 0),
  dimension = integer(),
  eps = .Machine$double.eps,
  method = .(mda::polyreg),
  ...
)

PDAModel(lambda = 1, df = numeric(), ...)
```

**Arguments**

<code>theta</code>	optional matrix of class scores, typically with number of columns less than one minus the number of classes.
<code>dimension</code>	dimension of the discriminant subspace, less than the number of classes, to use for prediction.
<code>eps</code>	numeric threshold for small singular values for excluding discriminant variables.
<code>method</code>	regression function used in optimal scaling. The default of linear regression is provided by <code>polyreg</code> from the <b>mda</b> package. For penalized discriminant analysis, <code>gen.ridge</code> is appropriate. Other possibilities are <code>mars</code> for multivariate adaptive regression splines and <code>bruto</code> for adaptive backfitting of additive splines. Use the <code>.</code> operator to quote specified functions.
<code>...</code>	additional arguments to method for <code>FDAModel</code> and to <code>FDAModel</code> for <code>PDAModel</code> .
<code>lambda</code>	shrinkage penalty coefficient.
<code>df</code>	alternative specification of <code>lambda</code> in terms of equivalent degrees of freedom.

## Details

**Response types:** factor

**Automatic tuning of grid parameters:**

- FDAModel: nprune, degree\*
- PDAModel: lambda

\* excluded from grids by default

The `predict` function for this model additionally accepts the following argument.

`prior` prior class membership probabilities for prediction data if different from the training set.

Default argument values and further model details can be found in the source See Also links below.

## Value

MLModel class object.

## See Also

[fda](#), [predict.fda](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package mda to run
```

```
fit(Species ~ ., data = iris, model = FDAModel)

```
## Requires prior installation of suggested package mda to run
```

```
fit(Species ~ ., data = iris, model = PDAModel)
```

---

fit

---

*Model Fitting*

---

## Description

Fit a model to estimate its parameters from a data set.

## Usage

```
fit(...)
```

```
## S3 method for class 'formula'
```

```
fit(formula, data, model, ...)
```

```
## S3 method for class 'matrix'
```

```

fit(x, y, model, ...)

## S3 method for class 'ModelFrame'
fit(input, model, ...)

## S3 method for class 'recipe'
fit(input, model, ...)

## S3 method for class 'ModelSpecification'
fit(object, verbose = FALSE, ...)

## S3 method for class 'MLModel'
fit(model, ...)

## S3 method for class 'MLModelFunction'
fit(model, ...)

```

## Arguments

...	arguments passed from the generic function to its methods, from the <code>MLModel</code> and <code>MLModelFunction</code> methods to first arguments of others, and from others to the <code>ModelSpecification</code> method. The first argument of each <code>fit</code> method is positional and, as such, must be given first in calls to them.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them.
model	<a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model. A model can be given first followed by any of the variable specifications.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.
input	<a href="#">input</a> object defining and containing the model predictor and response variables.
object	model <a href="#">specification</a> .
verbose	logical indicating whether to display printed output generated by some model-specific fit functions to aid in monitoring progress and diagnosing errors.

## Details

User-specified case weights may be specified for `ModelFrames` upon creation with the [weights](#) argument in its constructor.

Variables in recipe specifications may be designated as case weights with the [role\\_case](#) function.

## Value

`MLModelFit` class object.

## See Also

[as.MLModel](#), [response](#), [predict](#), [varimp](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

## Survival response example
library(survival)

gbm_fit <- fit(Surv(time, status) ~ ., data = veteran, model = GBMModel)
varimp(gbm_fit)
```

GAMBoostModel

*Gradient Boosting with Additive Models***Description**

Gradient boosting for optimizing arbitrary loss functions, where component-wise arbitrary base-learners, e.g., smoothing procedures, are utilized as additive base-learners.

**Usage**

```
GAMBoostModel(
  family = NULL,
  baselearner = c("bbs", "bols", "btree", "bss", "bns"),
  dfbase = 4,
  mstop = 100,
  nu = 0.1,
  risk = c("inbag", "oobag", "none"),
  stopintern = FALSE,
  trace = FALSE
)
```

**Arguments**

family	optional <a href="#">Family</a> object. Set automatically according to the class type of the response variable.
baselearner	character specifying the component-wise <a href="#">base learner</a> to be used.
dfbase	global degrees of freedom for P-spline base learners ("bbs").
mstop	number of initial boosting iterations.
nu	step size or shrinkage parameter between 0 and 1.
risk	method to use in computing the empirical risk for each boosting iteration.
stopintern	logical indicating whether the boosting algorithm stops internally when the out-of-bag risk increases at a subsequent iteration.
trace	logical indicating whether status information is printed during the fitting process.

## Details

**Response types:** binary factor, BinomialVariate, NegBinomialVariate, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameter:** mstop

Default argument values and further model details can be found in the source See Also links below.

## Value

MLModel class object.

## See Also

[gamboost](#), [Family](#), [baselearners](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package mboost to run

data(Pima.tr, package = "MASS")

fit(type ~ ., data = Pima.tr, model = GAMBoostModel)
```

---

GBMModel

*Generalized Boosted Regression Model*

---

## Description

Fits generalized boosted regression models.

## Usage

```
GBMModel(
  distribution = character(),
  n.trees = 100,
  interaction.depth = 1,
  n.minobsinnode = 10,
  shrinkage = 0.1,
  bag.fraction = 0.5
)
```

**Arguments**

distribution	optional character string specifying the name of the distribution to use or list with a component name specifying the distribution and any additional parameters needed. Set automatically according to the class type of the response variable.
n.trees	total number of trees to fit.
interaction.depth	maximum depth of variable interactions.
n.minobsinnode	minimum number of observations in the trees terminal nodes.
shrinkage	shrinkage parameter applied to each tree in the expansion.
bag.fraction	fraction of the training set observations randomly selected to propose the next tree in the expansion.

**Details**

**Response types:** factor, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameters:** n.trees, interaction.depth, shrinkage\*, n.minobsinnode\*

\* excluded from grids by default

Default argument values and further model details can be found in the source See Also link below.

**Value**

MLModel class object.

**See Also**

[gbm](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

fit(Species ~ ., data = iris, model = GBMModel)
```

**Description**

Gradient boosting for optimizing arbitrary loss functions where component-wise linear models are utilized as base-learners.

**Usage**

```
GLMBoostModel(
  family = NULL,
  mstop = 100,
  nu = 0.1,
  risk = c("inbag", "oobag", "none"),
  stopintern = FALSE,
  trace = FALSE
)
```

**Arguments**

family	optional <a href="#">Family</a> object. Set automatically according to the class type of the response variable.
mstop	number of initial boosting iterations.
nu	step size or shrinkage parameter between 0 and 1.
risk	method to use in computing the empirical risk for each boosting iteration.
stopintern	logical indicating whether the boosting algorithm stops internally when the out-of-bag risk increases at a subsequent iteration.
trace	logical indicating whether status information is printed during the fitting process.

**Details**

**Response types:** binary factor, BinomialVariate, NegBinomialVariate, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameter:** mstop

Default argument values and further model details can be found in the source See Also links below.

**Value**

MLModel class object.

**See Also**

[glmboost](#), [Family](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package mboost to run

data(Pima.tr, package = "MASS")

fit(type ~ ., data = Pima.tr, model = GLMBoostModel)
```

GLMMModel

*Generalized Linear Model***Description**

Fits generalized linear models, specified by giving a symbolic description of the linear predictor and a description of the error distribution.

**Usage**

```
GLMMModel(family = NULL, quasi = FALSE, ...)

GLMStepAICModel(
  family = NULL,
  quasi = FALSE,
  ...,
  direction = c("both", "backward", "forward"),
  scope = list(),
  k = 2,
  trace = FALSE,
  steps = 1000
)
```

**Arguments**

family	optional error distribution and link function to be used in the model. Set automatically according to the class type of the response variable.
quasi	logical indicator for over-dispersion of binomial and Poisson families; i.e., dispersion parameters not fixed at one.
...	arguments passed to <a href="#">glm.control</a> .
direction	mode of stepwise search, can be one of "both" (default), "backward", or "forward".
scope	defines the range of models examined in the stepwise search. This should be a list containing components upper and lower, both formulae.
k	multiple of the number of degrees of freedom used for the penalty. Only k = 2 gives the genuine AIC; k = .(log(nobs)) is sometimes referred to as BIC or SBC.
trace	if positive, information is printed during the running of stepAIC. Larger values may give more information on the fitting process.
steps	maximum number of steps to be considered.

**Details**

GLMMModel **Response types:** BinomialVariate, factor, matrix, NegBinomialVariate, numeric, PoissonVariate

GLMStepAICModel **Response types:** binary factor, BinomialVariate, NegBinomialVariate, numeric, PoissonVariate

Default argument values and further model details can be found in the source See Also links below.

In calls to `varimp` for GLMModel and GLMStepAICModel, numeric argument base may be specified for the (negative) logarithmic transformation of p-values [default: `exp(1)`]. Transformed p-values are automatically scaled in the calculation of variable importance to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`.

### Value

MLModel class object.

### See Also

`glm`, `glm.control`, `stepAIC`, `fit`, `resample`

### Examples

```
fit(sale_amount ~ ., data = ICHomes, model = GLMModel)
```

---

GLMNetModel

*GLM Lasso or Elasticnet Model*

---

### Description

Fit a generalized linear model via penalized maximum likelihood.

### Usage

```
GLMNetModel(
  family = NULL,
  alpha = 1,
  lambda = 0,
  standardize = TRUE,
  intercept = logical(),
  penalty.factor = .(rep(1, nvars)),
  standardize.response = FALSE,
  thresh = 1e-07,
  maxit = 1e+05,
  type.gaussian = .(if (nvars < 500) "covariance" else "naive"),
  type.logistic = c("Newton", "modified.Newton"),
  type.multinomial = c("ungrouped", "grouped")
)
```

**Arguments**

family	optional response type. Set automatically according to the class type of the response variable.
alpha	elasticnet mixing parameter.
lambda	regularization parameter. The default value <code>lambda = 0</code> performs no regularization and should be increased to avoid model fitting issues if the number of predictor variables is greater than the number of observations.
standardize	logical flag for predictor variable standardization, prior to model fitting.
intercept	logical indicating whether to fit intercepts.
penalty.factor	vector of penalty factors to be applied to each coefficient.
standardize.response	logical indicating whether to standardize "mgaussian" response variables.
thresh	convergence threshold for coordinate descent.
maxit	maximum number of passes over the data for all lambda values.
type.gaussian	algorithm type for gaussian models.
type.logistic	algorithm type for logistic models.
type.multinomial	algorithm type for multinomial models.

**Details**

**Response types:** BinomialVariate, factor, matrix, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameters:** lambda, alpha

Default argument values and further model details can be found in the source [See Also](#) link below.

**Value**

MLModel class object.

**See Also**

[glmnet](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package glmnet to run

fit(sale_amount ~ ., data = ICHomes, model = GLMNetModel(lambda = 0.01))
```

ICHomes

*Iowa City Home Sales Dataset***Description**

Characteristics of homes sold in Iowa City, IA from 2005 to 2008 as reported by the county assessor's office.

**Usage**

ICHomes

**Format**

A data frame with 753 observations of 17 variables:

**sale\_amount** sale amount in dollars.

**sale\_year** sale year.

**sale\_month** sale month.

**built** year in which the home was built.

**style** home stlye (Home/Condo)

**construction** home construction type.

**base\_size** base foundation size in sq ft.

**add\_size** size of additions made to the base foundation in sq ft.

**garage1\_size** attached garage size in sq ft.

**garage2\_size** detached garage size in sq ft.

**lot\_size** total lot size in sq ft.

**bedrooms** number of bedrooms.

**basement** presence of a basement (No/Yes).

**ac** presence of central air conditioning (No/Yes).

**attic** presence of a finished attic (No/Yes).

**lon,lat** home longitude/latitude coordinates.

---

inputs	<i>Model Inputs</i>
--------	---------------------

---

**Description**

Model inputs are the predictor and response variables whose relationship is determined by a model fit. Input specifications supported by **MachineShop** are summarized in the table below.

<code>formula</code>	Traditional model formula
<code>matrix</code>	Design matrix of predictors
<code>ModelFrame</code>	Model frame
<code>ModelSpecification</code>	Model specification
<code>recipe</code>	Preprocessing recipe roles and steps

Response variable types in the input specifications are defined by the user with the functions and recipe roles:

<b>Response Functions</b>	<code>BinomialVariate</code> <code>DiscreteVariate</code> <code>factor</code> <code>matrix</code> <code>NegBinomialVariate</code> <code>numeric</code> <code>ordered</code> <code>PoissonVariate</code> <code>Surv</code>
<b>Recipe Roles</b>	<code>role_binom</code> <code>role_surv</code>

Inputs may be combined, selected, or tuned with the following meta-input functions.

<code>ModelSpecification</code>	Model specification
<code>SelectedInput</code>	Input selection from a candidate set
<code>TunedInput</code>	Input tuning over a parameter grid

**See Also**

`fit`, `resample`

KNNModel

*Weighted k-Nearest Neighbor Model***Description**

Fit a k-nearest neighbor model for which the k nearest training set vectors (according to Minkowski distance) are found for each row of the test set, and prediction is done via the maximum of summed kernel densities.

**Usage**

```
KNNModel(
  k = 7,
  distance = 2,
  scale = TRUE,
  kernel = c("optimal", "biweight", "cos", "epanechnikov", "gaussian", "inv", "rank",
    "rectangular", "triangular", "triweight")
)
```

**Arguments**

k	numer of neighbors considered.
distance	Minkowski distance parameter.
scale	logical indicating whether to scale predictors to have equal standard deviations.
kernel	kernel to use.

**Details**

**Response types:** factor, numeric, ordinal

**Automatic tuning of grid parameters:** k, distance\*, kernel\*

\* excluded from grids by default

Further model details can be found in the source link below.

**Value**

MLModel class object.

**See Also**

[kkn](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package kkn to run

fit(Species ~ ., data = iris, model = KNNModel)
```

---

LARSMoel	<i>Least Angle Regression, Lasso and Infinitesimal Forward Stagewise Models</i>
----------	---

---

## Description

Fit variants of Lasso, and provide the entire sequence of coefficients and fits, starting from zero to the least squares fit.

## Usage

```
LARSMoel(  
  type = c("lasso", "lar", "forward.stagewise", "stepwise"),  
  trace = FALSE,  
  normalize = TRUE,  
  intercept = TRUE,  
  step = numeric(),  
  use.Gram = TRUE  
)
```

## Arguments

type	model type.
trace	logical indicating whether status information is printed during the fitting process.
normalize	whether to standardize each variable to have unit L2 norm.
intercept	whether to include an intercept in the model.
step	algorithm step number to use for prediction. May be a decimal number indicating a fractional distance between steps. If specified, the maximum number of algorithm steps will be ceiling(step); otherwise, step will be set equal to the source package default maximum [default: max.steps].
use.Gram	whether to precompute the Gram matrix.

## Details

**Response types:** numeric

**Automatic tuning of grid parameter:** step

Default argument values and further model details can be found in the source See Also link below.

## Value

MLMoel class object.

## See Also

[lars](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package lars to run

fit(sale_amount ~ ., data = ICHomes, model = LARSModel)
```

LDAModel

*Linear Discriminant Analysis Model***Description**

Performs linear discriminant analysis.

**Usage**

```
LDAModel(
  prior = numeric(),
  tol = 1e-04,
  method = c("moment", "mle", "mve", "t"),
  nu = 5,
  dimen = integer(),
  use = c("plug-in", "debiased", "predictive")
)
```

**Arguments**

prior	prior probabilities of class membership if specified or the class proportions in the training set otherwise.
tol	tolerance for the determination of singular matrices.
method	type of mean and variance estimator.
nu	degrees of freedom for method = "t".
dimen	dimension of the space to use for prediction.
use	type of parameter estimation to use for prediction.

**Details**

**Response types:** factor

**Automatic tuning of grid parameter:** dimen

The `predict` function for this model additionally accepts the following argument.

`prior` prior class membership probabilities for prediction data if different from the training set.

Default argument values and further model details can be found in the source See Also links below.

**Value**

MLModel class object.

**See Also**

[lda](#), [predict.lda](#), [fit](#), [resample](#)

**Examples**

```
fit(Species ~ ., data = iris, model = LDAModel)
```

---

lift	<i>Model Lift Curves</i>
------	--------------------------

---

**Description**

Calculate lift curves from observed and predicted responses.

**Usage**

```
lift(x, y = NULL, weights = NULL, na.rm = TRUE, ...)
```

**Arguments**

x	<a href="#">observed responses</a> or <a href="#">resample</a> result containing observed and predicted responses.
y	<a href="#">predicted responses</a> if not contained in x.
weights	numeric vector of non-negative <a href="#">case weights</a> for the observed x responses [default: equal weights].
na.rm	logical indicating whether to remove observed or predicted responses that are NA when calculating metrics.
...	arguments passed to other methods.

**Value**

LiftCurve class object that inherits from PerformanceCurve.

**See Also**

[c](#), [plot](#), [summary](#)

## Examples

```
## Requires prior installation of suggested package gbm to run

data(Pima.tr, package = "MASS")

res <- resample(type ~ ., data = Pima.tr, model = GBMModel)
lf <- lift(res)
plot(lf)
```

---

LMModel

*Linear Models*

---

## Description

Fits linear models.

## Usage

```
LMModel()
```

## Details

**Response types:** factor, matrix, numeric

Further model details can be found in the source link below.

In calls to [varimp](#) for LModel, numeric argument base may be specified for the (negative) logarithmic transformation of p-values [default: `exp(1)`]. Transformed p-values are automatically scaled in the calculation of variable importance to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`.

## Value

LMModel class object.

## See Also

[lm](#), [fit](#), [resample](#)

## Examples

```
fit(sale_amount ~ ., data = ICHomes, model = LMModel)
```

MDAModel

*Mixture Discriminant Analysis Model***Description**

Performs mixture discriminant analysis.

**Usage**

```
MDAModel(
  subclasses = 3,
  sub.df = numeric(),
  tot.df = numeric(),
  dimension = sum(subclasses) - 1,
  eps = .Machine$double.eps,
  iter = 5,
  method = .(mda::polyreg),
  trace = FALSE,
  ...
)
```

**Arguments**

<code>subclasses</code>	numeric value or vector of subclasses per class.
<code>sub.df</code>	effective degrees of freedom of the centroids per class if subclass centroid shrinkage is performed.
<code>tot.df</code>	specification of the total degrees of freedom as an alternative to <code>sub.df</code> .
<code>dimension</code>	dimension of the discriminant subspace to use for prediction.
<code>eps</code>	numeric threshold for automatically truncating the dimension.
<code>iter</code>	limit on the total number of iterations.
<code>method</code>	regression function used in optimal scaling. The default of linear regression is provided by <a href="#">polyreg</a> from the <b>mda</b> package. For penalized mixture discriminant models, <a href="#">gen.ridge</a> is appropriate. Other possibilities are <a href="#">mars</a> for multivariate adaptive regression splines and <a href="#">bruto</a> for adaptive backfitting of additive splines. Use the <code>.</code> operator to quote specified functions.
<code>trace</code>	logical indicating whether iteration information is printed.
<code>...</code>	additional arguments to <code>mda.start</code> and <code>method</code> .

**Details**

**Response types:** factor

**Automatic tuning of grid parameter:** subclasses

The [predict](#) function for this model additionally accepts the following argument.

`prior` prior class membership probabilities for prediction data if different from the training set.

Default argument values and further model details can be found in the source See Also links below.

**Value**

MLModel class object.

**See Also**

[mda](#), [predict.mda](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package mda to run
fit(Species ~ ., data = iris, model = MDAModel)
```

---

metricinfo

*Display Performance Metric Information*

---

**Description**

Display information about metrics provided by the **MachineShop** package.

**Usage**

```
metricinfo(...)
```

**Arguments**

... [metric](#) functions or function names; [observed responses](#); [observed](#) and [predicted responses](#); [confusion](#) or [resample](#) results for which to display information. If none are specified, information is returned on all available metrics by default.

**Value**

List of named metric elements each containing the following components:

**label** character descriptor for the metric.

**maximize** logical indicating whether higher values of the metric correspond to better predictive performance.

**arguments** closure with the argument names and corresponding default values of the metric function.

**response\_types** data frame of the observed and predicted response variable types supported by the metric.

**Examples**

```
## All metrics
metricinfo()

## Metrics by observed and predicted response types
names(metricinfo(factor(0)))
names(metricinfo(factor(0), factor(0)))
names(metricinfo(factor(0), matrix(0)))
names(metricinfo(factor(0), numeric(0)))

## Metric-specific information
metricinfo(auc)
```

---

metrics	<i>Performance Metrics</i>
---------	----------------------------

---

**Description**

Compute measures of agreement between observed and predicted responses.

**Usage**

```
accuracy(

    distr = character(),
    ...
)

rmse(observed, predicted = NULL, weights = NULL, ...)

rmsle(observed, predicted = NULL, weights = NULL, ...)

```

### Arguments

observed	<a href="#">observed responses</a> ; or <a href="#">confusion</a> , <a href="#">performance curve</a> , or <a href="#">resample</a> result containing observed and predicted responses.
predicted	<a href="#">predicted responses</a> if not contained in observed.
weights	numeric vector of non-negative <a href="#">case weights</a> for the observed responses [default: equal weights].
cutoff	numeric (0, 1) threshold above which binary factor probabilities are classified as events and below which survival probabilities are classified. If NULL, then confusion matrix-based metrics are computed on predicted class probabilities if given.
...	arguments passed to or from other methods.
multiclass	character string specifying the method for computing generalized area under the performance curve for multiclass factor responses. Options are to average over areas for each pair of classes ("pairs") or for each class versus all others ("all").
metrics	vector of two metric functions or function names that define a curve under which to calculate area [default: ROC metrics].
stat	function or character string naming a function to compute a summary statistic at each cutoff value of resampled metrics in performance curves, or NULL for resample-specific metrics.
beta	relative importance of recall to precision in the calculation of <code>f_score</code> [default: F1 score].
fun	function to calculate a desired sensitivity-specificity tradeoff.
power	power to which positional distances of off-diagonals from the main diagonal in confusion matrices are raised to calculate <code>weighted_kappa2</code> .
method	character string specifying whether to compute <code>r2</code> as the coefficient of determination ("mse") or as the square of "pearson" or "spearman" correlation.
distr	character string specifying a distribution with which to estimate the observed survival mean in the total sum of square component of <code>r2</code> . Possible values are "empirical" for the Kaplan-Meier estimator, "exponential", "extreme", "gaussian", "loggaussian", "logistic", "loglogistic", "lognormal", "rayleigh", "t", or "weibull". Defaults to the distribution that was used in predicting mean survival times.

MLControl

*Resampling Controls*

---

## Description

Structures to define and control sampling methods for estimation of model predictive performance in the **MachineShop** package.

## Usage

```
BootControl(  
  samples = 25,  
  weights = TRUE,  
  seed = sample(.Machine$integer.max, 1)  
)  
  
BootOptimismControl(  
  samples = 25,  
  weights = TRUE,  
  seed = sample(.Machine$integer.max, 1)  
)  
  
CVControl(  
  folds = 10,  
  repeats = 1,  
  weights = TRUE,  
  seed = sample(.Machine$integer.max, 1)  
)  
  
CVOptimismControl(  
  folds = 10,  
  repeats = 1,  
  weights = TRUE,  
  seed = sample(.Machine$integer.max, 1)  
)  
  
OOBControl(  
  samples = 25,  
  weights = TRUE,
```

```

    seed = sample(.Machine$integer.max, 1)
  )

  SplitControl(
    prop = 2/3,
    weights = TRUE,
    seed = sample(.Machine$integer.max, 1)
  )

  TrainControl(weights = TRUE, seed = sample(.Machine$integer.max, 1))

```

### Arguments

<code>samples</code>	number of bootstrap samples.
<code>weights</code>	logical indicating whether to return case weights in resampled output for the calculation of performance <a href="#">metrics</a> .
<code>seed</code>	integer to set the seed at the start of resampling.
<code>folds</code>	number of cross-validation folds (K).
<code>repeats</code>	number of repeats of the K-fold partitioning.
<code>prop</code>	proportion of cases to include in the training set ( $0 < \text{prop} < 1$ ).

### Details

`BootControl` constructs an `MLControl` object for simple bootstrap resampling in which models are fit with bootstrap resampled training sets and used to predict the full data set (Efron and Tibshirani 1993).

`BootOptimismControl` constructs an `MLControl` object for optimism-corrected bootstrap resampling (Efron and Gong 1983, Harrell et al. 1996).

`CVControl` constructs an `MLControl` object for repeated K-fold cross-validation (Kohavi 1995). In this procedure, the full data set is repeatedly partitioned into K-folds. Within a partitioning, prediction is performed on each of the K folds with models fit on all remaining folds.

`CVOptimismControl` constructs an `MLControl` object for optimism-corrected cross-validation resampling (Davison and Hinkley 1997, eq. 6.48).

`OOBControl` constructs an `MLControl` object for out-of-bootstrap resampling in which models are fit with bootstrap resampled training sets and used to predict the unsampled cases.

`SplitControl` constructs an `MLControl` object for splitting data into a separate training and test set (Hastie et al. 2009).

`TrainControl` constructs an `MLControl` object for training and performance evaluation to be performed on the same training set (Efron 1986).

### Value

Object that inherits from the `MLControl` class.

## Examples

```
## Bootstrapping with 100 samples
BootControl(samples = 100)

## Optimism-corrected bootstrapping with 100 samples
BootOptimismControl(samples = 100)

## Cross-validation with 5 repeats of 10 folds
CVControl(folds = 10, repeats = 5)

## Optimism-corrected cross-validation with 5 repeats of 10 folds
CVOptimismControl(folds = 10, repeats = 5)

## Out-of-bootstrap validation with 100 samples
OOBControl(samples = 100)

## Split sample validation with 2/3 training and 1/3 testing
SplitControl(prop = 2/3)

## Training set evaluation
TrainControl()
```

**Description**

Create a performance metric for use with the **MachineShop** package.

**Usage**

```
MLMetric(object, name = "MLMetric", label = name, maximize = TRUE)
```

```
MLMetric(object) <- value
```

**Arguments**

object	function to compute the metric, defined to accept observed and predicted as the first two arguments and with an ellipsis (...) to accommodate others.
name	character name of the object to which the metric is assigned.
label	optional character descriptor for the model.
maximize	logical indicating whether higher values of the metric correspond to better predictive performance.
value	list of arguments to pass to the <code>MLMetric</code> constructor.

**Value**

MLMetric class object.

**See Also**

[metrics](#)

**Examples**

```
f2_score <- MLMetric(  
  function(observed, predicted, ...) {  
    f_score(observed, predicted, beta = 2, ...)  
  },  
  name = "f2_score",  
  label = "F Score (beta = 2)",  
  maximize = TRUE  
)
```

## Description

Create a model or model function for use with the **MachineShop** package.

## Usage

```
MLModel(
  name = "MLModel",
  label = name,
  packages = character(),
  response_types = character(),
  weights = FALSE,
  predictor_encoding = c(NA, "model.frame", "model.matrix"),
  na.rm = FALSE,
  params = list(),
  gridinfo = tibble::tibble(param = character(), get_values = list(), default =
    logical()),
  fit = function(formula, data, weights, ...) stop("No fit function."),
  predict = function(object, newdata, times, ...) stop("No predict function."),
  varimp = function(object, ...) NULL,
  ...
)

MLModelFunction(object, ...)
```

## Arguments

name	character name of the object to which the model is assigned.
label	optional character descriptor for the model.
packages	character vector of package names upon which the model depends. Each name may be optionally followed by a comment in parentheses specifying a version requirement. The comment should contain a comparison operator, whitespace and a valid version number, e.g. "xgboost (>= 1.3.0)".
response_types	character vector of response variable types to which the model can be fit. Supported types are "binary", "BinomialVariate", "DiscreteVariate", "factor", "matrix", "NegBinomialVariate", "numeric", "ordered", "PoissonVariate", and "Surv".
weights	logical value or vector of the same length as response_types indicating whether case weights are supported for the responses.
predictor_encoding	character string indicating whether the model is fit with predictor variables encoded as a "model.frame", a "model.matrix", or unspecified (default).

<code>na.rm</code>	character string or logical specifying removal of "all" (TRUE) cases with missing values from model fitting and prediction, "none" (FALSE), or only those whose missing values are in the "response" variable.
<code>params</code>	list of user-specified model parameters to be passed to the <code>fit</code> function.
<code>gridinfo</code>	tibble of information for construction of tuning grids consisting of a character column <code>param</code> with the names of parameters in the grid, a list column <code>get_values</code> with functions to generate grid points for the corresponding parameters, and an optional logical column <code>default</code> indicating which parameters to include by default in regular grids. Values functions may optionally include arguments <code>n</code> and <code>data</code> for the number of grid points to generate and a <a href="#">ModelFrame</a> of the model fit data and formula, respectively; and must include an ellipsis (...).
<code>fit</code>	model fitting function whose arguments are a formula, a <a href="#">ModelFrame</a> named <code>data</code> , case weights, and an ellipsis.
<code>predict</code>	model prediction function whose arguments are the object returned by <code>fit</code> , a <a href="#">ModelFrame</a> named <code>newdata</code> of predictor variables, optional vector of times at which to predict survival, and an ellipsis.
<code>varimp</code>	variable importance function whose arguments are the object returned by <code>fit</code> , optional arguments passed from calls to <a href="#">varimp</a> , and an ellipsis.
<code>...</code>	arguments passed to other methods.
<code>object</code>	function that returns an <code>MLModel</code> object when called without any supplied argument values.

## Details

If supplied, the `grid` function should return a list whose elements are named after and contain values of parameters to include in a tuning grid to be constructed automatically by the package.

Arguments `data` and `newdata` in the `fit` and `predict` functions may be converted to data frames with `as.data.frame()` if needed for their operation. The `fit` function should return the object resulting from the model fit. Values returned by the `predict` functions should be formatted according to the response variable types below.

**factor** matrix whose columns contain the probabilities for multi-level factors or vector of probabilities for the second level of binary factors.

**matrix** matrix of predicted responses.

**numeric** vector or column matrix of predicted responses.

**Surv** matrix whose columns contain survival probabilities at times if supplied or a vector of predicted survival means otherwise.

The `varimp` function should return a vector of importance values named after the predictor variables or a matrix or data frame whose rows are named after the predictors.

The `predict` and `varimp` functions are additionally passed a list named `.MachineShop` containing the `input` and `model` from `fit`. This argument may be included in the function definitions as needed for their implementations. Otherwise, it will be captured by the ellipsis.

## Value

An `MLModel` or `MLModelFunction` class object.

**See Also**

[models](#), [fit](#), [resample](#)

**Examples**

```
## Logistic regression model
LogisticModel <- MLModel(
  name = "LogisticModel",
  response_types = "binary",
  weights = TRUE,
  fit = function(formula, data, weights, ...) {
    glm(formula, data = as.data.frame(data), weights = weights,
        family = binomial, ...)
  },
  predict = function(object, newdata, ...) {
    predict(object, newdata = as.data.frame(newdata), type = "response")
  },
  varimp = function(object, ...) {
    pchisq(coef(object)^2 / diag(vcov(object)), 1)
  }
)

data(Pima.tr, package = "MASS")
res <- resample(type ~ ., data = Pima.tr, model = LogisticModel)
summary(res)
```

---

ModelFrame

*ModelFrame Class*

---

**Description**

Class for storing data, formulas, and other attributes for **MachineShop** model fitting.

**Usage**

```
ModelFrame(...)

## S3 method for class 'formula'
ModelFrame(
  formula,
  data,
  groups = NULL,
  strata = NULL,
  weights = NULL,
  na.rm = TRUE,
  ...
)
```

```
## S3 method for class 'matrix'
ModelFrame(
  x,
  y = NULL,
  offsets = NULL,
  groups = NULL,
  strata = NULL,
  weights = NULL,
  na.rm = TRUE,
  ...
)
```

### Arguments

...	arguments passed from the generic function to its methods. The first argument of each ModelFrame method is positional and, as such, must be given first in calls to them.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them. In the associated method, arguments groups, strata, and weights will be evaluated as expressions, whose objects are searched for first in the accompanying data environment and, if not found there, next in the calling environment.
groups	vector of values defining groupings of case observations, such as repeated measurements, to keep together during resampling [default: none].
strata	vector of values to use in conducting stratified <a href="#">resample</a> estimation of model performance [default: none].
weights	numeric vector of non-negative case weights for the y response variable [default: equal weights].
na.rm	character string or logical specifying removal of "all" (TRUE) cases with missing values, "none" (FALSE), or only those whose missing values are in the "response" variable.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.
offsets	numeric vector, matrix, or data frame of values to be added with a fixed coefficient of 1 to linear predictors in compatible regression models.

### Value

ModelFrame class object that inherits from `data.frame`.

### See Also

[fit](#), [resample](#), [response](#), [SelectedInput](#)

### Examples

```
## Requires prior installation of suggested package gbm to run
```

```
mf <- ModelFrame(ncases / (ncases + ncontrols) ~ agegp + tobgp + alcgp,
                 data = esoph, weights = ncases + ncontrols)
gbm_fit <- fit(mf, model = GBMModel)
varimp(gbm_fit)
```

---

modelinfo

*Display Model Information*

---

## Description

Display information about models supplied by the **MachineShop** package.

## Usage

```
modelinfo(...)
```

## Arguments

... [model](#) functions, function names, or objects; [observed responses](#) for which to display information. If none are specified, information is returned on all available models by default.

## Value

List of named model elements each containing the following components:

**label** character descriptor for the model.

**packages** character vector of source packages required to use the model. These need only be installed with the [install.packages](#) function or by equivalent means; but need not be loaded with, for example, the [library](#) function.

**response\_types** character vector of response variable types supported by the model.

**weights** logical value or vector of the same length as `response_types` indicating whether case weights are supported for the responses.

**arguments** closure with the argument names and corresponding default values of the model function.

**grid** logical indicating whether automatic generation of tuning parameter grids is implemented for the model.

**varimp** logical indicating whether model-specific variable importance is defined.

**Examples**

```
## All models
modelinfo()

## Models by response types
names(modelinfo(factor(0)))
names(modelinfo(factor(0), numeric(0)))

## Model-specific information
modelinfo(GBMModel)
```

---

models	<i>Models</i>
--------	---------------

---

**Description**

Model constructor functions supplied by **MachineShop** are summarized in the table below according to the types of response variables with which each can be used.

Function	Categorical	Continuous	Survival
<a href="#">AdaBagModel</a>	f		
<a href="#">AdaBoostModel</a>	f		
<a href="#">BARTModel</a>	f	n	S
<a href="#">BARTMachineModel</a>	b	n	
<a href="#">BlackBoostModel</a>	b	n	S
<a href="#">C50Model</a>	f		
<a href="#">CForestModel</a>	f	n	S

XGBTreeModel	f	n	S

Categorical: b = binary, f = factor, o = ordered  
Continuous: m = matrix, n = numeric  
Survival: S = Surv

Models may be combined, tuned, or selected with the following meta-model functions.

ModelSpecification	Model specification
StackedModel	Stacked regression
SuperModel	Super learner
SelectedModel	Model selection from a candidate set
TunedModel	Model tuning over a parameter grid

See Also

[modelinfo](#), [fit](#), [resample](#)

**Description**

Specification of a relationship between response and predictor variables and a model to define a relationship between them.

**Usage**

```
ModelSpecification(...)

## Default S3 method:
ModelSpecification(
  input,
  model,
  control = MachineShop::settings("control"),
  metrics = NULL,
  cutoff = MachineShop::settings("cutoff"),
  stat = MachineShop::settings("stat.TrainingParams"),
  ...
)

## S3 method for class 'formula'
ModelSpecification(formula, data, model, ...)

## S3 method for class 'matrix'
ModelSpecification(x, y, model, ...)

## S3 method for class 'ModelFrame'
ModelSpecification(input, model, ...)

## S3 method for class 'recipe'
ModelSpecification(input, model, ...)
```

**Arguments**

...	arguments passed from the generic function to its methods. The first argument of each ModelSpecification method is positional and, as such, must be given first in calls to them.
input	<a href="#">input</a> object defining and containing the model predictor and response variables.
model	<a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model.
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed. If NULL or if the model specification contains any SelectedInput or SelectedModel objects, then object-specific control structures and training parameters are used for selection and tuning, as usual, and objects are trained sequentially with nested resampling. Otherwise, <ul style="list-style-type: none"> <li>tuning of input and model objects is performed simultaneously over a global grid of their parameter values, and</li> </ul>

	<ul style="list-style-type: none"> <li>the specified control method and training parameters below override those of any included TunedInput or TunedModel.</li> </ul>
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used. Model selection is based on the first calculated metric.
cutoff	argument passed to the metrics functions.
stat	function or character string naming a function to compute a summary statistic on resampled metric values for model tuning.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.

**Value**

ModelSpecification class object.

**See Also**

[fit](#), [resample](#), [set\\_monitor](#), [set\\_optim](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

modelspec <- ModelSpecification(
  sale_amount ~ ., data = ICHomes, model = GBMModel
)
fit(modelspec)
```

---

NaiveBayesModel

*Naive Bayes Classifier Model*

---

**Description**

Computes the conditional a-posterior probabilities of a categorical class variable given independent predictor variables using Bayes rule.

**Usage**

```
NaiveBayesModel(laplace = 0)
```

**Arguments**

laplace            positive numeric controlling Laplace smoothing.

**Details**

**Response types:** factor

Further model details can be found in the source link below.

**Value**

MLModel class object.

**See Also**

[naiveBayes](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package e1071 to run  
  
fit(Species ~ ., data = iris, model = NaiveBayesModel)
```

---

NNetModel

*Neural Network Model*

---

**Description**

Fit single-hidden-layer neural network, possibly with skip-layer connections.

**Usage**

```
NNetModel(  
  size = 1,  
  linout = logical(),  
  entropy = logical(),  
  softmax = logical(),  
  censored = FALSE,  
  skip = FALSE,  
  rang = 0.7,  
  decay = 0,  
  maxit = 100,  
  trace = FALSE,  
  MaxNWts = 1000,  
  abstol = 1e-04,  
  reltol = 1e-08  
)
```

**Arguments**

size	number of units in the hidden layer.
linout	switch for linear output units. Set automatically according to the class type of the response variable [numeric: TRUE, other: FALSE].
entropy	switch for entropy (= maximum conditional likelihood) fitting.
softmax	switch for softmax (log-linear model) and maximum conditional likelihood fitting.
censored	a variant on softmax, in which non-zero targets mean possible classes.
skip	switch to add skip-layer connections from input to output.
rang	Initial random weights on [-rang, rang].
decay	parameter for weight decay.
maxit	maximum number of iterations.
trace	switch for tracing optimization.
MaxNWts	maximum allowable number of weights.
abstol	stop if the fit criterion falls below abstol, indicating an essentially perfect fit.
reltol	stop if the optimizer is unable to reduce the fit criterion by a factor of at least 1 - reltol.

**Details**

**Response types:** factor, numeric

**Automatic tuning of grid parameters:** size, decay

Default argument values and further model details can be found in the source See Also link below.

**Value**

MLModel class object.

**See Also**

[nnet](#), [fit](#), [resample](#)

**Examples**

```
fit(sale_amount ~ ., data = ICHomes, model = NNetModel)
```

---

ParameterGrid	<i>Tuning Parameters Grid</i>
---------------	-------------------------------

---

**Description**

Defines a tuning grid from a set of parameters.

**Usage**

```
ParameterGrid(...)

## S3 method for class 'param'
ParameterGrid(..., size = 3, random = FALSE)

## S3 method for class 'list'
ParameterGrid(object, size = 3, random = FALSE, ...)

## S3 method for class 'parameters'
ParameterGrid(object, size = 3, random = FALSE, ...)
```

**Arguments**

...	named param objects as defined in the <b>dials</b> package.
size	single integer or vector of integers whose positions or names match the given parameters and which specify the number of values used to construct the grid.
random	number of unique points to sample at random from the grid defined by size, or FALSE for all points.
object	list of named param objects or a <a href="#">parameters</a> object. This is a positional argument that must be given first in calls to its methods.

**Value**

ParameterGrid class object that inherits from parameters and TuningGrid.

**See Also**

[TunedModel](#)

**Examples**

```
## GBMModel tuning parameters
grid <- ParameterGrid(
  n.trees = dials::trees(),
  interaction.depth = dials::tree_depth(),
  random = 5
)
TunedModel(GBMModel, grid = grid)
```

---

ParsnipModel

*Parsnip Model*

---

## Description

Convert a model specification from the **parsnip** package to one that can be used with the **MachinShop** package.

## Usage

```
ParsnipModel(object, ...)
```

## Arguments

`object`            [model specification](#) from the **parsnip** package.  
`...`            tuning parameters with which to update `object`.

## Value

ParsnipModel class object that inherits from MLModel.

## See Also

[as.MLModel](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package parsnip to run

prsp_model <- parsnip::linear_reg(engine = "glmnet")

model <- ParsnipModel(prsp_model, penalty = 1, mixture = 1)
model

model_fit <- fit(sale_amount ~ ., data = ICHomes, model = model)
predict(model_fit)
```

---

performance	<i>Model Performance Metrics</i>
-------------	----------------------------------

---

**Description**

Compute measures of model performance.

**Usage**

```
performance(x, ...)  
  
## S3 method for class 'BinomialVariate'  
performance(  
  x,  
  y,  
  weights = NULL,  
  metrics = MachineShop::settings("metrics.numeric"),  
  na.rm = TRUE,  
  ...  
)  
  
## S3 method for class 'factor'  
performance(  
  x,  
  y,  
  weights = NULL,  
  metrics = MachineShop::settings("metrics.factor"),  
  cutoff = MachineShop::settings("cutoff"),  
  na.rm = TRUE,  
  ...  
)  
  
## S3 method for class 'matrix'  
performance(  
  x,  
  y,  
  weights = NULL,  
  metrics = MachineShop::settings("metrics.matrix"),  
  na.rm = TRUE,  
  ...  
)  
  
## S3 method for class 'numeric'  
performance(  
  x,  
  y,  
  weights = NULL,
```

```

    metrics = MachineShop::settings("metrics.numeric"),
    na.rm = TRUE,
    ...
)

## S3 method for class 'Surv'
performance(
  x,
  y,
  weights = NULL,
  metrics = MachineShop::settings("metrics.Surv"),
  cutoff = MachineShop::settings("cutoff"),
  na.rm = TRUE,
  ...
)

## S3 method for class 'ConfusionList'
performance(x, ...)

## S3 method for class 'ConfusionMatrix'
performance(x, metrics = MachineShop::settings("metrics.ConfusionMatrix"), ...)

## S3 method for class 'MLModel'
performance(x, ...)

## S3 method for class 'Resample'
performance(x, ...)

## S3 method for class 'TrainingStep'
performance(x, ...)

```

## Arguments

<code>x</code>	<a href="#">observed responses</a> ; or <a href="#">confusion</a> , trained model <a href="#">fit</a> , <a href="#">resample</a> , or <a href="#">rfe</a> result.
<code>...</code>	arguments passed from the <code>Resample</code> method to the response type-specific methods or from the method for <code>ConfusionList</code> to <code>ConfusionMatrix</code> . Elliptical arguments in the response type-specific methods are passed to metrics supplied as a single <a href="#">MLMetric</a> function and are ignored otherwise.
<code>y</code>	<a href="#">predicted responses</a> if not contained in <code>x</code> .
<code>weights</code>	numeric vector of non-negative <a href="#">case weights</a> for the observed <code>x</code> responses [default: equal weights].
<code>metrics</code>	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance.
<code>na.rm</code>	logical indicating whether to remove observed or predicted responses that are NA when calculating metrics.
<code>cutoff</code>	numeric (0, 1) threshold above which binary factor probabilities are classified as events and below which survival probabilities are classified.

**See Also**[plot](#), [summary](#)**Examples**

```
## Requires prior installation of suggested package gbm to run

res <- resample(Species ~ ., data = iris, model = GBMModel)
(perf <- performance(res))
summary(perf)
plot(perf)

## Survival response example
library(survival)

gbm_fit <- fit(Surv(time, status) ~ ., data = veteran, model = GBMModel)

obs <- response(gbm_fit, newdata = veteran)
pred <- predict(gbm_fit, newdata = veteran)
performance(obs, pred)
```

---

performance_curve	<i>Model Performance Curves</i>
-------------------	---------------------------------

---

**Description**

Calculate curves for the analysis of tradeoffs between metrics for assessing performance in classifying binary outcomes over the range of possible cutoff probabilities. Available curves include receiver operating characteristic (ROC) and precision recall.

**Usage**

```
performance_curve(x, ...)

## Default S3 method:
performance_curve(
  x,
  y,
  weights = NULL,
  metrics = c(MachineShop::tpr, MachineShop::fpr),
  na.rm = TRUE,
  ...
)

## S3 method for class 'Resample'
performance_curve(
```

```

    x,
    metrics = c(MachineShop::tpr, MachineShop::fpr),
    na.rm = TRUE,
    ...
  )

```

### Arguments

<code>x</code>	<a href="#">observed responses</a> or <a href="#">resample</a> result containing observed and predicted responses.
<code>...</code>	arguments passed to other methods.
<code>y</code>	<a href="#">predicted responses</a> if not contained in <code>x</code> .
<code>weights</code>	numeric vector of non-negative <a href="#">case weights</a> for the observed <code>x</code> responses [default: equal weights].
<code>metrics</code>	list of two performance <a href="#">metrics</a> for the analysis [default: ROC metrics]. Precision recall curves can be obtained with <code>c(precision, recall)</code> .
<code>na.rm</code>	logical indicating whether to remove observed or predicted responses that are NA when calculating metrics.

### Value

PerformanceCurve class object that inherits from `data.frame`.

### See Also

[auc](#), [c](#), [plot](#), [summary](#)

### Examples

```

## Requires prior installation of suggested package gbm to run

data(Pima.tr, package = "MASS")

res <- resample(type ~ ., data = Pima.tr, model = GBMModel)

## ROC curve
roc <- performance_curve(res)
plot(roc)
auc(roc)

```

**Description**

Plot measures of model performance and predictor variable importance.

**Usage**

```
## S3 method for class 'Calibration'

  ...
)

## S3 method for class 'VariableImportance'
plot(x, n = Inf, ...)
```

### Arguments

x	<a href="#">calibration</a> , <a href="#">confusion</a> , <a href="#">lift</a> , trained model <a href="#">fit</a> , partial <a href="#">dependence</a> , <a href="#">performance</a> , <a href="#">performance curve</a> , <a href="#">resample</a> , <a href="#">rfe</a> , or <a href="#">variable importance</a> result.
type	type of plot to construct.
se	logical indicating whether to include standard error bars.
...	arguments passed to other methods.
find	numeric true positive rate at which to display reference lines identifying the corresponding rates of positive predictions.
diagonal	logical indicating whether to include a diagonal reference line.
stat	function or character string naming a function to compute a summary statistic on resampled metrics for trained <code>MLModel</code> line plots and <code>Resample</code> model ordering. The original ordering is preserved if a value of <code>NULL</code> is given. For <code>LiftCurve</code> and <code>PerformanceCurve</code> classes, plots are of resampled metrics aggregated by the statistic if given or of resample-specific metrics if <code>NULL</code> .
metrics	vector of numeric indexes or character names of performance metrics to plot.

stats	vector of numeric indexes or character names of partial dependence summary statistics to plot.
n	number of most important variables to include in the plot.

### Examples

```
## Requires prior installation of suggested package gbm to run

## Factor response example

fo <- Species ~ .
control <- CVControl()

gbm_fit <- fit(fo, data = iris, model = GBMModel, control = control)
plot(varimp(gbm_fit))

gbm_res1 <- resample(fo, iris, GBMModel(n.trees = 25), control)
gbm_res2 <- resample(fo, iris, GBMModel(n.trees = 50), control)
gbm_res3 <- resample(fo, iris, GBMModel(n.trees = 100), control)
plot(gbm_res3)

res <- c(GBM1 = gbm_res1, GBM2 = gbm_res2, GBM3 = gbm_res3)
plot(res)
```

---

PLSModel

*Partial Least Squares Model*

---

### Description

Function to perform partial least squares regression.

### Usage

```
PLSModel(ncomp = 1, scale = FALSE)
```

### Arguments

ncomp	number of components to include in the model.
scale	logical indicating whether to scale the predictors by the sample standard deviation.

### Details

**Response types:** factor, numeric

**Automatic tuning of grid parameters:** ncomp

Further model details can be found in the source link below.

**Value**

MLModel class object.

**See Also**

[mvr](#), [fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package pls to run

fit(sale_amount ~ ., data = ICHomes, model = PLSModel)
```

---

POLRModel

*Ordered Logistic or Probit Regression Model*

---

**Description**

Fit a logistic or probit regression model to an ordered factor response.

**Usage**

```
POLRModel(method = c("logistic", "probit", "loglog", "cloglog", "cauchit"))
```

**Arguments**

method            logistic or probit or (complementary) log-log or cauchit (corresponding to a Cauchy latent variable).

**Details**

**Response types:** ordered

Further model details can be found in the source link below.

In calls to [varimp](#) for POLRModel, numeric argument base may be specified for the (negative) logarithmic transformation of p-values [default: `exp(1)`]. Transformed p-values are automatically scaled in the calculation of variable importance to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`.

**Value**

MLModel class object.

**See Also**

[polr](#), [fit](#), [resample](#)

**Examples**

```
data(Boston, package = "MASS")

df <- within(Boston,
  medv <- cut(medv,
    breaks = c(0, 10, 15, 20, 25, 50),
    ordered = TRUE))
fit(medv ~ ., data = df, model = POLRModel)
```

---

predict	<i>Model Prediction</i>
---------	-------------------------

---

**Description**

Predict outcomes with a fitted model.

**Usage**

```
## S3 method for class 'MLModelFit'
predict(
  object,
  newdata = NULL,
  times = numeric(),
  type = c("response", "raw", "numeric", "prob", "default"),
  cutoff = MachineShop::settings("cutoff"),
  distr = character(),
  method = character(),
  verbose = FALSE,
  ...
)

## S4 method for signature 'MLModelFit'
predict(object, ...)
```

**Arguments**

<b>object</b>	model <a href="#">fit</a> result.
<b>newdata</b>	optional <a href="#">data frame</a> with which to obtain predictions. If not specified, the training data will be used by default.
<b>times</b>	numeric vector of follow-up times at which to predict survival events/probabilities or NULL for predicted survival means.
<b>type</b>	specifies prediction on the original outcome ("response"), numeric ("numeric"), or probability ("prob") scale; or the "raw" predictions returned by the model. Option "default" is deprecated and will be removed in the future; use "raw" instead.

cutoff	numeric (0, 1) threshold above which binary factor probabilities are classified as events and below which survival probabilities are classified.
distr	character string specifying distributional approximations to estimated survival curves. Possible values are "empirical", "exponential", "rayleigh", or "weibull"; with defaults of "empirical" for predicted survival events/probabilities and "weibull" for predicted survival means.
method	character string specifying the empirical method of estimating baseline survival curves for Cox proportional hazards-based models. Choices are "breslow" or "efron" (default).
verbose	logical indicating whether to display printed output generated by some model-specific predict functions to aid in monitoring progress and diagnosing errors.
...	arguments passed from the S4 to the S3 method.

### See Also

### Examples

```
## Requires prior installation of suggested package gbm to run

## Survival response example
library(survival)

gbm_fit <- fit(Surv(time, status) ~ ., data = veteran, model = GBMModel)
predict(gbm_fit, newdata = veteran, times = c(90, 180, 360), type = "prob")
```

---

print	<i>Print MachineShop Objects</i>
-------	----------------------------------

---

### Description

Print methods for objects defined in the **MachineShop** package.

### Usage

```
## S3 method for class 'BinomialVariate'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'Calibration'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'DiscreteVariate'
print(x, n = MachineShop::settings("print_max"), ...)
```

```
## S3 method for class 'ListOf'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'MLControl'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'MLMetric'
print(x, ...)

## S3 method for class 'MLModel'
print(x, n = MachineShop::settings("print_max"), id = FALSE, ...)

## S3 method for class 'MLModelFunction'
print(x, ...)

## S3 method for class 'ModelFrame'
print(x, n = MachineShop::settings("print_max"), id = FALSE, data = TRUE, ...)

## S3 method for class 'ModelRecipe'
print(x, n = MachineShop::settings("print_max"), id = FALSE, data = TRUE, ...)

## S3 method for class 'ModelSpecification'
print(x, n = MachineShop::settings("print_max"), id = FALSE, ...)

## S3 method for class 'Performance'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'PerformanceCurve'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'RecipeGrid'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'Resample'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'SurvMatrix'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'SurvTimes'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'TrainingStep'
print(x, n = MachineShop::settings("print_max"), ...)

## S3 method for class 'VariableImportance'
print(x, n = MachineShop::settings("print_max"), ...)
```

Arguments

x	object to print.
n	integer number of models or data frame rows to show.
...	arguments passed to other methods, including the one described below.
	level = 0 current nesting level of the corresponding object in recursive calls to print. The amount of information displayed decreases and increases with positive and negative levels, respectively.
id	logical indicating whether to show object identifiers.
data	logical indicating whether to show model data.

---

QDAModel	<i>Quadratic Discriminant Analysis Model</i>
----------	--

---

Description

Performs quadratic discriminant analysis.

Usage

```
QDAModel(  
  prior = numeric(),  
  method = c("moment", "mle", "mve", "t"),  
  nu = 5,  
  use = c("plug-in", "predictive", "debiased", "looCV")  
)
```

Arguments

prior	prior probabilities of class membership if specified or the class proportions in the training set otherwise.
method	type of mean and variance estimator.
nu	degrees of freedom for method = "t".
use	type of parameter estimation to use for prediction.

Details

**Response types:** factor

The [predict](#) function for this model additionally accepts the following argument.

prior prior class membership probabilities for prediction data if different from the training set.

Default argument values and further model details can be found in the source See Also links below.

Value

MLModel class object.

**See Also**

[qda](#), [predict.qda](#), [fit](#), [resample](#)

**Examples**

```
fit(Species ~ ., data = iris, model = QDAModel)
```

---

quote	<i>Quote Operator</i>
-------	-----------------------

---

**Description**

Shorthand notation for the [quote](#) function. The quote operator simply returns its argument unevaluated and can be applied to any R expression.

**Usage**

```
.(expr)
```

**Arguments**

`expr` any syntactically valid R expression.

**Details**

Useful for calling [model functions](#) with quoted parameter values defined in terms of one or more of the following variables.

`nobs` number of observations in data to be [fit](#).

`nvars` number of predictor variables.

`y` the response variable.

**Value**

The quoted (unevaluated) expression.

**See Also**

[quote](#)

**Examples**

```
## Stepwise variable selection with BIC
glm_fit <- fit(sale_amount ~ ., ICHomes, GLMStepAICModel(k = .(log(nobs))))
varimp(glm_fit)
```

---

RandomForestModel	<i>Random Forest Model</i>
-------------------	----------------------------

---

## Description

Implementation of Breiman's random forest algorithm (based on Breiman and Cutler's original Fortran code) for classification and regression.

## Usage

```
RandomForestModel(
  ntree = 500,
  mtry = .(if (is.factor(y)) floor(sqrt(nvars)) else max(floor(nvars/3), 1)),
  replace = TRUE,
  nodesize = .(if (is.factor(y)) 1 else 5),
  maxnodes = integer()
)
```

## Arguments

<code>ntree</code>	number of trees to grow.
<code>mtry</code>	number of variables randomly sampled as candidates at each split.
<code>replace</code>	should sampling of cases be done with or without replacement?
<code>nodesize</code>	minimum size of terminal nodes.
<code>maxnodes</code>	maximum number of terminal nodes trees in the forest can have.

## Details

**Response types:** factor, numeric

**Automatic tuning of grid parameters:** `mtry`, `nodesize`\*

\* excluded from grids by default

Default argument values and further model details can be found in the source See Also link below.

## Value

MLModel class object.

## See Also

[randomForest](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package randomForest to run

fit(sale_amount ~ ., data = ICHomes, model = RandomForestModel)
```

---

RangerModel

*Fast Random Forest Model*

---

## Description

Fast implementation of random forests or recursive partitioning.

## Usage

```
RangerModel(
  num.trees = 500,
  mtry = integer(),
  importance = c("impurity", "impurity_corrected", "permutation"),
  min.node.size = integer(),
  replace = TRUE,
  sample.fraction = if (replace) 1 else 0.632,
  splitrule = character(),
  num.random.splits = 1,
  alpha = 0.5,
  minprop = 0.1,
  split.select.weights = numeric(),
  always.split.variables = character(),
  respect.unordered.factors = character(),
  scale.permutation.importance = FALSE,
  verbose = FALSE
)
```

## Arguments

num.trees	number of trees.
mtry	number of variables to possibly split at in each node.
importance	variable importance mode.
min.node.size	minimum node size.
replace	logical indicating whether to sample with replacement.
sample.fraction	fraction of observations to sample.
splitrule	splitting rule.
num.random.splits	number of random splits to consider for each candidate splitting variable in the "extratrees" rule.
alpha	significance threshold to allow splitting in the "maxstat" rule.
minprop	lower quantile of covariate distribution to be considered for splitting in the "maxstat" rule.

`split.select.weights`  
 numeric vector with weights between 0 and 1, representing the probability to select variables for splitting.

`always.split.variables`  
 character vector with variable names to be always selected in addition to the `mtry` variables tried for splitting.

`respect.unordered.factors`  
 handling of unordered factor covariates.

`scale.permutation.importance`  
 scale permutation importance by standard error.

`verbose`  
 show computation status and estimated runtime.

### Details

**Response types:** factor, numeric, Surv

**Automatic tuning of grid parameters:** `mtry`, `min.node.size*`, `splitrule*`

\* excluded from grids by default

Default argument values and further model details can be found in the source See Also link below.

### Value

MLModel class object.

### See Also

[ranger](#), [fit](#), [resample](#)

### Examples

```
## Requires prior installation of suggested package ranger to run
fit(Species ~ ., data = iris, model = RangerModel)
```

---

recipe\_roles

*Set Recipe Roles*

---

### Description

Add to or replace the roles of variables in a preprocessing recipe.

**Usage**

```

role_binom(recipe, x, size)

role_case(recipe, group, stratum, weight, replace = FALSE)

role_pred(recipe, offset, replace = FALSE)

role_surv(recipe, time, event)

```

**Arguments**

recipe	existing <a href="#">recipe</a> object.
x, size	number of counts and trials for the specification of a <a href="#">BinomialVariate</a> outcome.
group	variable defining groupings of case observations, such as repeated measurements, to keep together during resampling [default: none].
stratum	variable to use in conducting stratified <a href="#">resample</a> estimation of model performance.
weight	numeric variable of case weights for model <a href="#">fitting</a> .
replace	logical indicating whether to replace existing roles.
offset	numeric variable to be added to a linear predictor, such as in a generalized linear model, with known coefficient 1 rather than an estimated coefficient.
time, event	numeric follow up time and 0-1 numeric or logical event indicator for specification of a <a href="#">Surv</a> outcome. If the event indicator is omitted, all cases are assumed to have events.

**Value**

An updated recipe object.

**See Also**

[recipe](#)

**Examples**

```

library(survival)
library(recipes)

df <- within(veteran, {
  y <- Surv(time, status)
  remove(time, status)
})
rec <- recipe(y ~ ., data = df) %>%
  role_case(stratum = y)

(res <- resample(rec, model = CoxModel))
summary(res)

```

resample

*Resample Estimation of Model Performance***Description**

Estimation of the predictive performance of a model estimated and evaluated on training and test samples generated from an observed data set.

**Usage**

```
resample(...)

## S3 method for class 'formula'
resample(formula, data, model, ...)

## S3 method for class 'matrix'
resample(x, y, model, ...)

## S3 method for class 'ModelFrame'
resample(input, model, ...)

## S3 method for class 'recipe'
resample(input, model, ...)

## S3 method for class 'ModelSpecification'
resample(object, control = MachineShop::settings("control"), ...)

## S3 method for class 'MLModel'
resample(model, ...)

## S3 method for class 'MLModelFunction'
resample(model, ...)
```

**Arguments**

...	arguments passed from the generic function to its methods, from the MLModel and MLModelFunction methods to first arguments of others, and from others to the ModelSpecification method. The first argument of each fit method is positional and, as such, must be given first in calls to them.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them.
model	<a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model. A model can be given first followed by any of the variable specifications.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.
input	<a href="#">input</a> object defining and containing the model predictor and response variables.

object	model <a href="#">input</a> or <a href="#">specification</a> .
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.

## Details

Stratified resampling is performed automatically for the formula and matrix methods according to the type of response variable. In general, strata are constructed from numeric proportions for [BinomialVariate](#); original values for character, factor, logical, and ordered; first columns of values for matrix; original values for numeric; and numeric times within event statuses for Surv. Numeric values are stratified into quantile bins and categorical values into factor levels defined by [MLControl](#).

Resampling stratification variables may be specified manually for `ModelFrames` upon creation with the [strata](#) argument in their constructor. Resampling of this class is unstratified by default.

Stratification variables may be designated in recipe specifications with the [role\\_case](#) function. Resampling will be unstratified otherwise.

## Value

Resample class object.

## See Also

[c](#), [metrics](#), [performance](#), [plot](#), [summary](#)

## Examples

```
## Requires prior installation of suggested package gbm to run

## Factor response example

fo <- Species ~ .
control <- CVControl()

gbm_res2 <- resample(fo, iris, GBMModel(n.trees = 50), control)
gbm_res3 <- resample(fo, iris, GBMModel(n.trees = 100), control)

summary(gbm_res1)
plot(gbm_res1)

res <- c(GBM1 = gbm_res1, GBM2 = gbm_res2, GBM3 = gbm_res3)
summary(res)
plot(res)
```

---

response	<i>Extract Response Variable</i>
----------	----------------------------------

---

## Description

Extract the response variable from an object.

## Usage

```
response(object, ...)  
  
## S3 method for class 'MLModelFit'  
response(object, newdata = NULL, ...)  
  
## S3 method for class 'ModelFrame'  
response(object, newdata = NULL, ...)  
  
## S3 method for class 'ModelSpecification'  
response(object, newdata = NULL, ...)  
  
## S3 method for class 'recipe'  
response(object, newdata = NULL, ...)
```

## Arguments

object	model <a href="#">fit</a> , <a href="#">input</a> , or <a href="#">specification</a> containing predictor and response variables.
...	arguments passed to other methods.
newdata	<a href="#">data frame</a> from which to extract the response variable values if given; otherwise, object is used.

## Examples

```
## Survival response example  
library(survival)  
  
mf <- ModelFrame(Surv(time, status) ~ ., data = veteran)  
response(mf)
```

---

rfe	<i>Recursive Feature Elimination</i>
-----	--------------------------------------

---

**Description**

A wrapper method of backward feature selection in which a given model is fit to nested subsets of most important predictor variables in order to select the subset whose resampled predictive performance is optimal.

**Usage**

```
rfe(...)

## S3 method for class 'formula'
rfe(formula, data, model, ...)

## S3 method for class 'matrix'
rfe(x, y, model, ...)

## S3 method for class 'ModelFrame'
rfe(input, model, ...)

## S3 method for class 'recipe'
rfe(input, model, ...)

## S3 method for class 'ModelSpecification'
rfe(
  object,
  select = NULL,
  control = MachineShop::settings("control"),
  props = 4,
  sizes = integer(),
  random = FALSE,
  recompute = TRUE,
  optimize = c("global", "local"),
  samples = c(rfe = 1, varimp = 1),
  metrics = NULL,
  stat = c(resample = MachineShop::settings("stat.Resample"), permute =
    MachineShop::settings("stat.TrainingParams")),
  progress = FALSE,
  ...
)

## S3 method for class 'MLModel'
rfe(model, ...)

## S3 method for class 'MLModelFunction'
```

```
rfe(model, ...)
```

## Arguments

...	arguments passed from the generic function to its methods, from the <code>MLModel</code> and <code>MLModelFunction</code> methods to first arguments of others, and from others to the <code>ModelSpecification</code> method. The first argument of each fit method is positional and, as such, must be given first in calls to them.
formula, data	<a href="#">formula</a> defining the model predictor and response variables and a <a href="#">data frame</a> containing them.
model	<a href="#">model</a> function, function name, or object; or another object that can be <a href="#">coerced</a> to a model. A model can be given first followed by any of the variable specifications.
x, y	<a href="#">matrix</a> and object containing predictor and response variables.
input	<a href="#">input</a> object defining and containing the model predictor and response variables.
object	model <a href="#">input</a> or <a href="#">specification</a> .
select	expression indicating predictor variables that can be eliminated (see <a href="#">subset</a> for syntax) [default: all].
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.
props	numeric vector of the proportions of most important predictor variables to retain in fitted models or an integer number of equal spaced proportions to generate automatically; ignored if sizes are given.
sizes	integer vector of the set sizes of most important predictor variables to retain.
random	logical indicating whether to eliminate variables at random with probabilities proportional to their importance.
recompute	logical indicating whether to recompute variable importance after eliminating each set of variables.
optimize	character string specifying a search through all props to identify the globally optimal model ("global") or a search that stops after identifying the first locally optimal model ("local").
samples	numeric vector or list giving the number of permutation samples for each of the <code>rfe</code> and <a href="#">varimp</a> algorithms. One or both of the values may be specified as named arguments or in the order in which their defaults appear. Larger numbers of samples decrease variability in estimated model performances and variable importances at the expense of increased computation time. Samples are more expensive computationally for <code>rfe</code> than for <code>varimp</code> .
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used.
stat	functions or character strings naming functions to compute summary statistics on resampled metric values and permuted samples. One or both of the values may be specified as named arguments or in the order in which their defaults appear.
progress	logical indicating whether to display iterative progress during elimination.

**Value**

TrainingStep class object containing a summary of the numbers of predictor variables retained (size), their names (terms), logical indicators for the optimal model selected (selected), and associated performance metrics (metrics).

**See Also**

[performance](#), [plot](#), [summary](#), [varimp](#)

**Examples**

```
## Requires prior installation of suggested package gbm to run

(res <- rfe(sale_amount ~ ., data = ICHomes, model = GBMModel))
summary(res)
summary(performance(res))
plot(res, type = "line")
```

---

RFSRCModel

*Fast Random Forest (SRC) Model*

---

**Description**

Fast OpenMP computing of Breiman's random forest for a variety of data settings including right-censored survival, regression, and classification.

**Usage**

```
RFSRCModel(
  ntree = 1000,
  mtry = integer(),
  nodesize = integer(),
  nodedepth = integer(),
  splitrule = character(),
  nsplit = 10,
  block.size = integer(),
  samptype = c("swor", "swr"),
  membership = FALSE,
  sampsize = if (samptype == "swor") function(x) 0.632 * x else function(x) x,
  nimpute = 1,
  ntime = integer(),
  proximity = c(FALSE, TRUE, "inbag", "oob", "all"),
  distance = c(FALSE, TRUE, "inbag", "oob", "all"),
  forest.wt = c(FALSE, TRUE, "inbag", "oob", "all"),
  xvar.wt = numeric(),
```

```

    split.wt = numeric(),
    var.used = c(FALSE, "all.trees", "by.tree"),
    split.depth = c(FALSE, "all.trees", "by.tree"),
    do.trace = FALSE,
    statistics = FALSE
  )

RFSRCFastModel(
  ntree = 500,
  sampsize = function(x) min(0.632 * x, max(x^0.75, 150)),
  ntime = 50,
  terminal.qualts = FALSE,
  ...
)

```

### Arguments

<code>ntree</code>	number of trees.
<code>mtry</code>	number of variables randomly selected as candidates for splitting a node.
<code>nodesize</code>	minumum size of terminal nodes.
<code>nodedepth</code>	maximum depth to which a tree should be grown.
<code>splitrule</code>	splitting rule (see <a href="#">rfsrc</a> ).
<code>nsplit</code>	non-negative integer value for number of random splits to consider for each candidate splitting variable.
<code>block.size</code>	interval number of trees at which to compute the cumulative error rate.
<code>samptype</code>	whether bootstrap sampling is with or without replacement.
<code>membership</code>	logical indicating whether to return terminal node membership.
<code>sampsize</code>	function specifying the bootstrap size.
<code>nimpute</code>	number of iterations of the missing data imputation algorithm.
<code>ntime</code>	integer number of time points to constrain ensemble calculations for survival outcomes.
<code>proximity</code>	whether and how to return proximity of cases as measured by the frequency of sharing the same terminal nodes.
<code>distance</code>	whether and how to return distance between cases as measured by the ratio of the sum of edges from each case to the root node.
<code>forest.wt</code>	whether and how to return the forest weight matrix.
<code>xvar.wt</code>	vector of non-negative weights representing the probability of selecting a variable for splitting.
<code>split.wt</code>	vector of non-negative weights used for multiplying the split statistic for a variable.
<code>var.used</code>	whether and how to return variables used for splitting.
<code>split.depth</code>	whether and how to return minimal depth for each variable.

<code>do.trace</code>	number of seconds between updates to the user on approximate time to completion.
<code>statistics</code>	logical indicating whether to return split statistics.
<code>terminal.qualts</code>	logical indicating whether to return terminal node membership information.
<code>...</code>	arguments passed to RFSRCModel.

## Details

**Response types:** factor, matrix, numeric, Surv

**Automatic tuning of grid parameters:** mtry, nodesize

Default argument values and further model details can be found in the source See Also links below.

In calls to `varimp` for RFSRCModel, argument type may be specified as "anti" (default) for cases assigned to the split opposite of the random assignments, as "permute" for permutation of OOB cases, or as "random" for permutation replaced with random assignment. Variable importance is automatically scaled to range from 0 to 100. To obtain unscaled importance values, set `scale = FALSE`. See example below.

## Value

MLModel class object.

## See Also

[rfsrc](#), [rfsrc.fast](#), [fit](#), [resample](#)

## Examples

```
## Requires prior installation of suggested package randomForestSRC to run

model_fit <- fit(sale_amount ~ ., data = ICHomes, model = RFSRCModel)
varimp(model_fit, method = "model", type = "random", scale = TRUE)
```

## Description

Fit an rpart model.

## Usage

```
RPartModel(  
  minsplit = 20,  
  minbucket = round(minsplit/3),  
  cp = 0.01,  
  maxcompete = 4,  
  maxsurrogate = 5,  
  usesurrogate = 2,  
  xval = 10,  
  surrogatestyle = 0,  
  maxdepth = 30  
)
```

## Arguments

minsplit	minimum number of observations that must exist in a node in order for a split to be attempted.
minbucket	minimum number of observations in any terminal node.
cp	complexity parameter.
maxcompete	number of competitor splits retained in the output.
maxsurrogate	number of surrogate splits retained in the output.
usesurrogate	how to use surrogates in the splitting process.
xval	number of cross-validations.
surrogatestyle	controls the selection of a best surrogate.
maxdepth	maximum depth of any node of the final tree, with the root node counted as depth 0.

## Details

**Response types:** factor, numeric, Surv

**Automatic tuning of grid parameter:** cp

Further model details can be found in the source link below.

## Value

MLModel class object.

)

## S3 method for class 'list'
SelectedInput(x, ...)

```

### Arguments

...	<a href="#">inputs</a> defining relationships between model predictor and response variables. Supplied inputs must all be of the same type and may be named or unnamed.
data	<a href="#">data frame</a> containing predictor and response variables.
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used. Recipe selection is based on the first calculated metric.
cutoff	argument passed to the metrics functions.
stat	function or character string naming a function to compute a summary statistic on resampled metric values for recipe selection.
y	response variable.
x	list of inputs followed by arguments passed to their method function.

### Value

SelectedModelFrame, SelectedModelRecipe, or SelectedModelSpecification class object that inherits from SelectedInput and ModelFrame, recipe, or ModelSpecification, respectively.

### See Also

[fit](#), [resample](#)

### Examples

```

## Selected model frame
sel_mf <- SelectedInput(
  sale_amount ~ sale_year + built + style + construction,
  sale_amount ~ sale_year + base_size + bedrooms + basement,
  data = ICHomes
)

```

```

fit(sel_mf, model = GLMModel)

## Selected recipe
library(recipes)
data(Boston, package = "MASS")

rec1 <- recipe(medv ~ crim + zn + indus + chas + nox + rm, data = Boston)
rec2 <- recipe(medv ~ chas + nox + rm + age + dis + rad + tax, data = Boston)
sel_rec <- SelectedInput(rec1, rec2)

fit(sel_rec, model = GLMModel)

```

---

SelectedModel

*Selected Model*

---

## Description

Model selection from a candidate set.

## Usage

```

SelectedModel(...)

## Default S3 method:
SelectedModel(
  ...,
  control = MachineShop::settings("control"),
  metrics = NULL,
  cutoff = MachineShop::settings("cutoff"),
  stat = MachineShop::settings("stat.TrainingParams")
)

## S3 method for class 'ModelSpecification'
SelectedModel(
  ...,
  control = MachineShop::settings("control"),
  metrics = NULL,
  cutoff = MachineShop::settings("cutoff"),
  stat = MachineShop::settings("stat.TrainingParams")
)

## S3 method for class 'list'
SelectedModel(x, ...)

```

**Arguments**

...	<a href="#">model</a> functions, function names, objects; other objects that can be <a href="#">coerced</a> to models; vectors of these to serve as the candidate set from which to select, such as that returned by <a href="#">expand_model</a> ; or model <a href="#">specifications</a> .
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used. Model selection is based on the first calculated metric.
cutoff	argument passed to the metrics functions.
stat	function or character string naming a function to compute a summary statistic on resampled metric values for model selection.
x	list of models followed by arguments passed to their method function.

**Details**

**Response types:** factor, numeric, ordered, Surv

**Value**

SelectedModel or SelectedModelSpecification class object that inherits from MLModel or ModelSpecification, respectively.

**See Also**

[fit](#), [resample](#)

**Examples**

```
## Requires prior installation of suggested package gbm and glmnet to run

model_fit <- fit(
  sale_amount ~ ., data = ICHomes,
  model = SelectedModel(GBMModel, GLMNetModel, SVMRadialModel)
)
(selected_model <- as.MLModel(model_fit))
summary(selected_model)
```

settings

*MachineShop Settings***Description**

Allow the user to view or change global settings which affect default behaviors of functions in the **MachineShop** package.

**Usage**

```
settings(...)
```

**Arguments**

... character names of settings to view, name = value pairs giving the values of settings to change, a vector of these, "reset" to restore all package defaults, or no arguments to view all settings. Partial matching of setting names is supported.

**Value**

The setting value if only one is specified to view. Otherwise, a list of the values of specified settings as they existed prior to any requested changes. Such a list can be passed as an argument to `settings` to restore their values.

**Settings**

`control` function, function name, or object defining a default resampling method [default: "CVControl"].

`cutoff` numeric (0, 1) threshold above which binary factor probabilities are classified as events and below which survival probabilities are classified [default: 0.5].

`distr.SurvMeans` character string specifying distributional approximations to estimated survival curves for predicting survival means. Choices are "empirical" for the Kaplan-Meier estimator, "exponential", "rayleigh", or "weibull" (default).

`distr.SurvProbs` character string specifying distributional approximations to estimated survival curves for predicting survival events/probabilities. Choices are "empirical" (default) for the Kaplan-Meier estimator, "exponential", "rayleigh", or "weibull".

`grid` size argument to `TuningGrid` indicating the number of parameter-specific values to generate automatically for `tuning` of models that have pre-defined grids or a `TuningGrid` function, function name, or object [default: 3].

`method.EmpiricalSurv` character string specifying the empirical method of estimating baseline survival curves for Cox proportional hazards-based models. Choices are "breslow" or "efron" (default).

`metrics.ConfusionMatrix` function, function name, or vector of these with which to calculate [performance metrics](#) for confusion matrices [default: `c(Accuracy = "accuracy", Kappa = "kappa2", `Weighted Kappa` = "weighted_kappa2", Sensitivity = "sensitivity", Specificity = "specificity")`].

`metrics.factor` function, function name, or vector of these with which to calculate [performance metrics](#) for factor responses [default: `c(Brier = "brier", Accuracy = "accuracy", Kappa = "kappa2", `Weighted Kappa` = "weighted_kappa2", `ROC AUC` = "roc_auc", Sensitivity = "sensitivity", Specificity = "specificity")`].

`metrics.matrix` function, function name, or vector of these with which to calculate [performance metrics](#) for matrix responses [default: `c(RMSE = "rmse", R2 = "r2", MAE = "mae")`].

`metrics.numeric` function, function name, or vector of these with which to calculate [performance metrics](#) for numeric responses [default: `c(RMSE = "rmse", R2 = "r2", MAE = "mae")`].

`metrics.Surv` function, function name, or vector of these with which to calculate [performance metrics](#) for survival responses [default: `c(`C-Index` = "cindex", Brier = "brier", `ROC AUC` = "roc_auc", Accuracy = "accuracy")`].

`print_max` number of models or data rows to show with print methods or `Inf` to show all [default: 10].

`require` names of installed packages to load during parallel execution of resampling algorithms [default: "MachineShop"].

`reset` character names of settings to reset to their default values.

`RHS.formula` non-modifiable character vector of operators and functions allowed in traditional formula specifications.

`stat.Curve` function or character string naming a function to compute one [summary](#) statistic at each cutoff value of resampled metrics in performance curves, or `NULL` for resample-specific metrics [default: "base::mean"].

`stat.Resample` function or character string naming a function to compute one summary statistic to control the ordering of models in [plots](#) [default: "base::mean"].

`stat.TrainingParams` function or character string naming a function to compute one summary statistic on resampled performance metrics for input [selection](#) or [tuning](#) or for model [selection](#) or [tuning](#) [default: "base::mean"].

`stats.PartialDependence` function, function name, or vector of these with which to compute [partial dependence](#) summary statistics [default: `c(Mean = "base::mean")`].

`stats.Resample` function, function name, or vector of these with which to compute [summary](#) statistics on resampled performance metrics [default: `c(Mean = "base::mean", Median = "stats::median", SD = "stats::sd", Min = "base::min", Max = "base::max")`].

## Examples

```
## View all current settings
settings()

## Change settings
presets <- settings(control = "BootControl", grid = 10)

## View one setting
settings("control")

## View multiple settings
settings("control", "grid")
```

```
## Restore the previous settings
settings(presets)
```

---

set\_monitor

*Training Parameters Monitoring Control*

---

## Description

Set parameters that control the monitoring of resample estimation of model performance and of tuning parameter optimization.

## Usage

```
set_monitor(object, ...)

## S3 method for class 'MLControl'
set_monitor(object, progress = TRUE, verbose = FALSE, ...)

## S3 method for class 'MLOptimization'
set_monitor(object, progress = FALSE, verbose = FALSE, ...)

## S3 method for class 'ModelSpecification'
set_monitor(object, which = c("all", "control", "optim"), ...)
```

## Arguments

object	resampling <a href="#">control</a> , tuning parameter <a href="#">optimization</a> , or model <a href="#">specification</a> object.
...	arguments passed from the ModelSpecification method to the others.
progress	logical indicating whether to display iterative progress during resampling or optimization. In the case of resampling, a progress bar will be displayed if a computing cluster is not registered or is registered with the <b>doSNOW</b> package.
verbose	numeric or logical value specifying the level of progress detail to print, with 0 (FALSE) indicating none and 1 (TRUE) or higher indicating increasing amounts of detail.
which	character string specifying the monitoring parameters to set as "all", "control", or optimization ("optim").

## Value

Argument object updated with the supplied parameters.

## See Also

**Examples**

```
CVControl() %>% set_monitor(verbose = TRUE)
```

---

set\_optim

*Tuning Parameter Optimization*

---

**Description**

Set the optimization method and control parameters for tuning of model parameters.

**Usage**

```
set_optim_bayes(object, ...)

## S3 method for class 'ModelSpecification'
set_optim_bayes(
  object,
  num_init = 5,
  times = 10,
  each = 1,
  acquisition = c("ucb", "ei", "eips", "poi"),
  kappa = stats::qnorm(conf),
  conf = 0.995,
  epsilon = 0,
  control = list(),
  packages = c("ParBayesianOptimization", "rBayesianOptimization"),
  random = FALSE,
  progress = verbose,
  verbose = 0,
  ...
)

set_optim_bfgs(object, ...)

## S3 method for class 'ModelSpecification'
set_optim_bfgs(
  object,
  times = 10,
  control = list(),
  random = FALSE,
  progress = FALSE,
  verbose = 0,
  ...
)

set_optim_grid(object, ...)
```

```
## S3 method for class 'TrainingParams'
set_optim_grid(object, random = FALSE, progress = FALSE, ...)

## S3 method for class 'ModelSpecification'
set_optim_grid(object, ...)

## S3 method for class 'TunedInput'
set_optim_grid(object, ...)

## S3 method for class 'TunedModel'
set_optim_grid(object, ...)

set_optim_pso(object, ...)

## S3 method for class 'ModelSpecification'
set_optim_pso(
  object,
  times = 10,
  each = NULL,
  control = list(),
  random = FALSE,
  progress = FALSE,
  verbose = 0,
  ...
)

set_optim_sann(object, ...)

## S3 method for class 'ModelSpecification'
set_optim_sann(
  object,
  times = 10,
  control = list(),
  random = FALSE,
  progress = FALSE,
  verbose = 0,
  ...
)

set_optim_method(object, ...)

## S3 method for class 'ModelSpecification'
set_optim_method(
  object,
  fun,
  label = "Optimization Function",
  packages = character(),
```

```

    params = list(),
    random = FALSE,
    progress = FALSE,
    verbose = FALSE,
    ...
)

```

## Arguments

object	<a href="#">input</a> or <a href="#">model</a> object.
...	arguments passed to the TrainingParams method of set_optim_grid from its other methods.
num_init	number of grid points to sample for the initialization of Bayesian optimization.
times	maximum number of times to repeat the optimization step. Multiple sets of model parameters are evaluated automatically at each step of the BFGS algorithm to compute a finite-difference approximation to the gradient.
each	number of times to sample and evaluate model parameters at each optimization step. This is the swarm size in particle swarm optimization, which defaults to $\text{floor}(10 + 2 * \text{sqrt}(\text{length}(\text{bounds})))$ .
acquisition	character string specifying the acquisition function as "ucb" (upper confidence bound), "ei" (expected improvement), "eips" (expected improvement per second), or "poi" (probability of improvement).
kappa, conf	upper confidence bound ("ucb") quantile or its probability to balance exploitation against exploration. Argument kappa takes precedence if both are given and multiplies the predictive standard deviation added to the predictive mean in the acquisition function. Larger values encourage exploration of the model parameter space.
epsilon	improvement methods ("ei", "eips", and "poi") parameter to balance exploitation against exploration. Values should be between -0.1 and 0.1 with larger ones encouraging exploration.
control	list of control parameters passed to <a href="#">bayesOpt</a> by set_optim_bayes with package "ParBayesianOptimization", to <a href="#">BayesianOptimization</a> by set_optim_bayes with package "rBayesianOptimization", to <a href="#">optim</a> by set_optim_bfgs and set_optim_sann, and to <a href="#">psoptim</a> by set_optim_pso.
packages	R package or packages to use for the optimization method, or an empty vector if none are needed. The first package in set_optim_bayes is used unless otherwise specified by the user.
random	number of points to sample for a random grid search, or FALSE for an exhaustive grid search. Used when a grid search is specified or as the fallback method for non-numeric model parameters present during other optimization methods.
progress	logical indicating whether to display iterative progress during optimization.
verbose	numeric or logical value specifying the level of progress detail to print, with 0 (FALSE) indicating none and 1 (TRUE) or higher indicating increasing amounts of detail.

fun	<p>user-defined optimization function to which the arguments below are passed in order. An ellipsis can be included in the function definition when using only a subset of the arguments and ignoring others. A tibble returned by the function with the same number of rows as model evaluations will be included in a TrainingStep summary of optimization results; other types of return values will be ignored.</p> <p><b>optim</b> function that takes a numeric vector or list of named model parameters as the first argument, optionally accepts the maximum number of iterations as argument <code>max_iter</code>, and returns a scalar measure of performance to be maximized. Parameter names are available from the grid and bounds arguments described below. If the function cannot be evaluated at a given set of parameter values, then <code>-Inf</code> is returned.</p> <p><b>grid</b> data frame containing a tuning grid of all model parameters.</p> <p><b>bounds</b> named list of lower and upper bounds for each finite numeric model parameter in <code>grid</code>. The types (integer or double) of the original parameter values are preserved in the bounds.</p> <p><b>params</b> list of optimization parameters as supplied to <code>set_optim_method</code>.</p> <p><b>monitor</b> list of the progress and verbose values.</p>
label	character descriptor for the optimization method.
params	list of user-specified model parameters to be passed to <code>fun</code> .

## Details

The optimization functions implement the following methods.

`set_optim_bayes` Bayesian optimization with a Gaussian process model (Snoek et al. 2012).

`set_optim_bfgs` limited-memory modification of quasi-Newton BFGS optimization (Byrd et al. 1995).

`set_optim_grid` exhaustive or random grid search.

`set_optim_pso` particle swarm optimization (Bratton and Kennedy 2007, Zambrano-Bigiarini et al. 2013).

`set_optim_sann` simulated annealing (Belisle 1992). This method depends critically on the control parameter settings. It is not a general-purpose method but can be very useful in getting to good parameter values on a very rough optimization surface.

`set_optim_method` user-defined optimization function.

The package-defined optimization functions evaluate and return values of the tuning parameters that are of same type (e.g. integer, double, character) as given in the object `grid`. Sequential optimization of numeric tuning parameters is performed over a hypercube defined by their minimum and maximum grid values. Non-numeric parameters are optimized with grid searches.

## Value

Argument object updated with the specified optimization method and control parameters.

set\_predict

*Resampling Prediction Control*

---

## Description

Set parameters that control prediction during resample estimation of model performance.

## Usage

```
set_predict(
  object,
  times = numeric(),
  distr = character(),
  method = character(),
  ...
)
```

## Arguments

**object** [control](#) object.  
**times, distr, method** arguments passed to [predict](#).  
**...** arguments passed to other methods.

**Value**

Argument object updated with the supplied parameters.

**See Also**

[resample](#), [set\\_monitor](#), [set\\_optim](#), [set\\_strata](#)

**Examples**

```
CVControl() %>% set_predict(times = 1:3)
```

---

set_strata	<i>Resampling Stratification Control</i>
------------	--

---

**Description**

Set parameters that control the construction of strata during resample estimation of model performance.

**Usage**

```
set_strata(object, breaks = 4, nunique = 5, prop = 0.1, size = 20, ...)
```

**Arguments**

object	<a href="#">control</a> object.
breaks	number of quantile bins desired for stratification of numeric data during resampling.
nunique	number of unique values at or below which numeric data are stratified as categorical.
prop	minimum proportion of data in each strata.
size	minimum number of values in each strata.
...	arguments passed to other methods.

**Details**

The arguments control resampling strata which are constructed from numeric proportions for [BinomialVariate](#); original values for character, factor, logical, numeric, and ordered; first columns of values for matrix; and numeric times within event statuses for Surv. Stratification of survival data by event status only can be achieved by setting breaks = 1. Numeric values are stratified into quantile bins and categorical values into factor levels. The number of bins will be the largest integer less than or equal to breaks satisfying the prop and size control argument thresholds. Categorical levels below the thresholds will be pooled iteratively by reassigning values in the smallest nominal level to the remaining ones at random and by combining the smallest adjacent ordinal levels. Missing values are replaced with non-missing values sampled at random with replacement.

**Value**

Argument object updated with the supplied parameters.

**See Also**

[resample](#), [set\\_monitor](#), [set\\_optim](#), [set\\_predict](#)

**Examples**

```
CVControl() %>% set_strata(breaks = 3)
```

---

StackedModel

*Stacked Regression Model*

---

**Description**

Fit a stacked regression model from multiple base learners.

**Usage**

```
StackedModel(
  ...,
  control = MachineShop::settings("control"),
  weights = numeric()
)
```

**Arguments**

...	<a href="#">model</a> functions, function names, objects; other objects that can be <a href="#">coerced</a> to models; or vector of these to serve as base learners.
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed for the estimation of base learner weights.
weights	optional fixed base learner weights.

**Details**

**Response types:** factor, numeric, ordered, Surv

**Value**

StackedModel class object that inherits from MLModel.

**References**

Breiman, L. (1996). Stacked regression. *Machine Learning*, 24, 49-64.

**See Also**[fit, resample](#)**Examples**

```
## Requires prior installation of suggested packages gbm and glmnet to run

model <- StackedModel(GBMModel, SVMRadialModel, GLMNetModel(lambda = 0.01))
model_fit <- fit(sale_amount ~ ., data = ICHomes, model = model)
predict(model_fit, newdata = ICHomes)
```

step\_kmeans

*K-Means Clustering Variable Reduction***Description**

Creates a *specification* of a recipe step that will convert numeric variables into one or more by averaging within k-means clusters.

**Usage**

```
step_kmeans(
  recipe,
  ...,
  k = 5,
  center = TRUE,
  scale = TRUE,
  algorithm = c("Hartigan-Wong", "Lloyd", "Forgy", "MacQueen"),
  max_iter = 10,
  num_start = 1,
  replace = TRUE,
  prefix = "KMeans",
  role = "predictor",
  skip = FALSE,
  id = recipes::rand_id("kmeans")
)

## S3 method for class 'step_kmeans'
tidy(x, ...)

## S3 method for class 'step_kmeans'
tunable(x, ...)
```

## Arguments

recipe	recipe object to which the step will be added.
...	one or more selector functions to choose which variables will be used to compute the components. See <a href="#">selections</a> for more details. These are not currently used by the tidy method.
k	number of k-means clusterings of the variables. The value of k is constrained to be between 1 and one less than the number of original variables.
center, scale	logicals indicating whether to mean center and standard deviation scale the original variables prior to deriving components, or functions or names of functions for the centering and scaling.
algorithm	character string specifying the clustering algorithm to use.
max_iter	maximum number of algorithm iterations allowed.
num_start	number of random cluster centers generated for starting the Hartigan-Wong algorithm.
replace	logical indicating whether to replace the original variables.
prefix	character string prefix added to a sequence of zero-padded integers to generate names for the resulting new variables.
role	analysis role that added step variables should be assigned. By default, they are designated as model predictors.
skip	logical indicating whether to skip the step when the recipe is baked. While all operations are baked when <a href="#">prep</a> is run, some operations may not be applicable to new data (e.g. processing outcome variables). Care should be taken when using skip = TRUE as it may affect the computations for subsequent operations.
id	unique character string to identify the step.
x	step_kmeans object.

## Details

K-means clustering partitions variables into k groups such that the sum of squares between the variables and their assigned cluster means is minimized. Variables within each cluster are then averaged to derive a new set of k variables.

## Value

Function `step_kmeans` creates a new step whose class is of the same name and inherits from [step\\_lincomp](#), adds it to the sequence of existing steps (if any) in the recipe, and returns the updated recipe. For the tidy method, a tibble with columns `terms` (selectors or variables selected), `cluster` assignments, `sqdist` (squared distance from cluster centers), and name of the new variable names.

---

step\_kmedoids

*K-Medoids Clustering Variable Selection*

---

### Description

Creates a *specification* of a recipe step that will partition numeric variables according to k-medoids clustering and select the cluster medoids.

### Usage

```
step_kmedoids(
  recipe,
  ...,
  k = 5,
  center = TRUE,
  scale = TRUE,
  method = c("pam", "clara"),
  metric = "euclidean",
  optimize = FALSE,
  num_samp = 50,
```

```

    samp_size = 40 + 2 * k,
    replace = TRUE,
    prefix = "KMedoids",
    role = "predictor",
    skip = FALSE,
    id = recipes::rand_id("kmedoids")
  )

  ## S3 method for class 'step_kmedoids'
  tunable(x, ...)

```

## Arguments

<code>recipe</code>	<a href="#">recipe</a> object to which the step will be added.
<code>...</code>	one or more selector functions to choose which variables will be used to compute the components. See <a href="#">selections</a> for more details. These are not currently used by the <code>tidy</code> method.
<code>k</code>	number of k-medoids clusterings of the variables. The value of <code>k</code> is constrained to be between 1 and one less than the number of original variables.
<code>center, scale</code>	logicals indicating whether to mean center and median absolute deviation scale the original variables prior to cluster partitioning, or functions or names of functions for the centering and scaling; not applied to selected variables.
<code>method</code>	character string specifying one of the clustering methods provided by the <b>cluster</b> package. The <code>clara</code> (clustering large applications) method is an extension of <code>pam</code> (partitioning around medoids) designed to handle large datasets.
<code>metric</code>	character string specifying the distance metric for calculating dissimilarities between observations as "euclidean", "manhattan", or "jaccard" ( <code>clara</code> only).
<code>optimize</code>	logical indicator or 0:5 integer level specifying optimization for the <a href="#">pam</a> clustering method.
<code>num_samp</code>	number of sub-datasets to sample for the <a href="#">clara</a> clustering method.
<code>samp_size</code>	number of cases to include in each sub-dataset.
<code>replace</code>	logical indicating whether to replace the original variables.
<code>prefix</code>	if the original variables are not replaced, the selected variables are added to the dataset with the character string prefix added to their names; otherwise, the original variable names are retained.
<code>role</code>	analysis role that added step variables should be assigned. By default, they are designated as model predictors.
<code>skip</code>	logical indicating whether to skip the step when the recipe is baked. While all operations are baked when <a href="#">prep</a> is run, some operations may not be applicable to new data (e.g. processing outcome variables). Care should be taken when using <code>skip = TRUE</code> as it may affect the computations for subsequent operations.
<code>id</code>	unique character string to identify the step.
<code>x</code>	<code>step_kmedoids</code> object.

## Details

K-medoids clustering partitions variables into k groups such that the dissimilarity between the variables and their assigned cluster medoids is minimized. Cluster medoids are then returned as a set of k variables.

## Value

Function `step_kmedoids` creates a new step whose class is of the same name and inherits from [step\\_sbf](#), adds it to the sequence of existing steps (if any) in the recipe, and returns the updated recipe. For the tidy method, a tibble with columns `terms` (selectors or variables selected), `cluster` assignments, `selected` (logical indicator of selected cluster medoids), `silhouette` (silhouette values), and `name` of the selected variable names.

step\_lincomp

*Linear Components Variable Reduction***Description**

Creates a *specification* of a recipe step that will compute one or more linear combinations of a set of numeric variables according to a user-specified transformation matrix.

**Usage**

```
step_lincomp(
  recipe,
  ...,
  transform,
  num_comp = 5,
  options = list(),
  center = TRUE,
  scale = TRUE,
  replace = TRUE,
  prefix = "LinComp",
  role = "predictor",
  skip = FALSE,
  id = recipes::rand_id("lincomp")
)

## S3 method for class 'step_lincomp'
tidy(x, ...)

## S3 method for class 'step_lincomp'
tunable(x, ...)
```

**Arguments**

recipe	<a href="#">recipe</a> object to which the step will be added.
...	one or more selector functions to choose which variables will be used to compute the components. See <a href="#">selections</a> for more details. These are not currently used by the tidy method.
transform	function whose first argument x is a matrix of variables with which to compute linear combinations and second argument step is the current step. The function should return a transformation <a href="#">matrix</a> or <a href="#">Matrix</a> of variable weights in its columns, or return a list with element <code>`weights`</code> containing the transformation matrix and possibly with other elements to be included as attributes in output from the tidy method.
num_comp	number of components to derive. The value of num_comp will be constrained to a minimum of 1 and maximum of the number of original variables when <a href="#">prep</a> is run.

options	list of elements to be added to the step object for use in the transform function.
center, scale	logicals indicating whether to mean center and standard deviation scale the original variables prior to deriving components, or functions or names of functions for the centering and scaling.
replace	logical indicating whether to replace the original variables.
prefix	character string prefix added to a sequence of zero-padded integers to generate names for the resulting new variables.
role	analysis role that added step variables should be assigned. By default, they are designated as model predictors.
skip	logical indicating whether to skip the step when the recipe is baked. While all operations are baked when <a href="#">prep</a> is run, some operations may not be applicable to new data (e.g. processing outcome variables). Care should be taken when using skip = TRUE as it may affect the computations for subsequent operations.
id	unique character string to identify the step.
x	step_lincomp object.

### Value

An updated version of recipe with the new step added to the sequence of existing steps (if any). For the tidy method, a tibble with columns terms (selectors or variables selected), weight of each variable in the linear transformations, and name of the new variable names.

### See Also

### Examples

```
library(recipes)

pca_mat <- function(x, step) {
  prcomp(x)$rotation[, 1:step$num_comp, drop = FALSE]
}

rec <- recipe(rating ~ ., data = attitude)
lincomp_rec <- rec %>%
  step_lincomp(all_numeric_predictors(),
    transform = pca_mat, num_comp = 3, prefix = "PCA")

lincomp_prep <- prep(lincomp_rec, training = attitude)
lincomp_data <- bake(lincomp_prep, attitude)

pairs(lincomp_data, lower.panel = NULL)

tidy(lincomp_rec, number = 1)
tidy(lincomp_prep, number = 1)
```

step\_sbf

Variable Selection by Filtering

**Description**

Creates a *specification* of a recipe step that will select variables from a candidate set according to a user-specified filtering function.

**Usage**

```
step_sbf(
  recipe,
  ...,
  filter,
  multivariate = FALSE,
  options = list(),
  replace = TRUE,
  prefix = "SBF",
  role = "predictor",
  skip = FALSE,
  id = recipes::rand_id("sbf")
)

## S3 method for class 'step_sbf'
tidy(x, ...)
```

**Arguments**

recipe	<a href="#">recipe</a> object to which the step will be added.
...	one or more selector functions to choose which variables will be used to compute the components. See <a href="#">selections</a> for more details. These are not currently used by the tidy method.
filter	function whose first argument x is a univariate vector or a multivariate data frame of candidate variables from which to select, second argument y is the response variable as defined in preceding recipe steps, and third argument step is the current step. The function should return a logical value or vector of length equal the number of variables in x indicating whether to select the corresponding variable, or return a list or data frame with element <code>`selected`</code> containing the logical(s) and possibly with other elements of the same length to be included in output from the tidy method.
multivariate	logical indicating that candidate variables be passed to the x argument of the filter function separately as univariate vectors if FALSE, or altogether in one multivariate data frame if TRUE.
options	list of elements to be added to the step object for use in the filter function.
replace	logical indicating whether to replace the original variables.

prefix	if the original variables are not replaced, the selected variables are added to the dataset with the character string prefix added to their names; otherwise, the original variable names are retained.
role	analysis role that added step variables should be assigned. By default, they are designated as model predictors.
skip	logical indicating whether to skip the step when the recipe is baked. While all operations are baked when <a href="#">prep</a> is run, some operations may not be applicable to new data (e.g. processing outcome variables). Care should be taken when using skip = TRUE as it may affect the computations for subsequent operations.
id	unique character string to identify the step.
x	step_sbf object.

### Value

An updated version of recipe with the new step added to the sequence of existing steps (if any). For the tidy method, a tibble with columns terms (selectors or variables selected), selected (logical indicator of selected variables), and name of the selected variable names.

### See Also

[recipe](#), [prep](#), [bake](#)

### Examples

```
library(recipes)

glm_filter <- function(x, y, step) {
  model_fit <- glm(y ~ ., data = data.frame(y, x))
  p_value <- drop1(model_fit, test = "F")[-1, "Pr(>F)"]
  p_value < step$threshold
}

rec <- recipe(rating ~ ., data = attitude)
sbf_rec <- rec %>%
  step_sbf(all_numeric_predictors(),
           filter = glm_filter, options = list(threshold = 0.05))

sbf_prep <- prep(sbf_rec, training = attitude)
sbf_data <- bake(sbf_prep, attitude)

pairs(sbf_data, lower.panel = NULL)

tidy(sbf_rec, number = 1)
tidy(sbf_prep, number = 1)
```

step\_spca

*Sparse Principal Components Analysis Variable Reduction***Description**

Creates a *specification* of a recipe step that will derive sparse principal components from one or more numeric variables.

**Usage**

```
step_spca(
  recipe,
  ...,
  num_comp = 5,
  sparsity = 0,
  num_var = integer(),
  shrinkage = 1e-06,
  center = TRUE,
  scale = TRUE,
  max_iter = 200,
  tol = 0.001,
  replace = TRUE,
  prefix = "SPCA",
  role = "predictor",
  skip = FALSE,
  id = recipes::rand_id("spca")
)

## S3 method for class 'step_spca'
tunable(x, ...)
```

**Arguments**

recipe	<a href="#">recipe</a> object to which the step will be added.
...	one or more selector functions to choose which variables will be used to compute the components. See <a href="#">selections</a> for more details. These are not currently used by the <code>tidy</code> method.
num_comp	number of components to derive. The value of <code>num_comp</code> will be constrained to a minimum of 1 and maximum of the number of original variables when <a href="#">prep</a> is run.
sparsity, num_var	sparsity (L1 norm) penalty for each component or number of variables with non-zero component loadings. Larger sparsity values produce more zero loadings. Argument <code>sparsity</code> is ignored if <code>num_var</code> is given. The argument value may be a single number applied to all components or a vector of component-specific numbers.

shrinkage	numeric shrinkage (quadratic) penalty for the components to improve conditioning; larger values produce more shrinkage of component loadings toward zero.
center, scale	logicals indicating whether to mean center and standard deviation scale the original variables prior to deriving components, or functions or names of functions for the centering and scaling.
max_iter	maximum number of algorithm iterations allowed.
tol	numeric tolerance for the convergence criterion.
replace	logical indicating whether to replace the original variables.
prefix	character string prefix added to a sequence of zero-padded integers to generate names for the resulting new variables.
role	analysis role that added step variables should be assigned. By default, they are designated as model predictors.
skip	logical indicating whether to skip the step when the recipe is baked. While all operations are baked when <a href="#">prep</a> is run, some operations may not be applicable to new data (e.g. processing outcome variables). Care should be taken when using skip = TRUE as it may affect the computations for subsequent operations.
id	unique character string to identify the step.
x	step_sPCA object.

## Details

Sparse principal components analysis (SPCA) is a variant of PCA in which the original variables may have zero loadings in the linear combinations that form the components.

## Value

Function `step_sPCA` creates a new step whose class is of the same name and inherits from [step\\_lincomp](#), adds it to the sequence of existing steps (if any) in the recipe, and returns the updated recipe. For the `tidy` method, a tibble with columns `terms` (selectors or variables selected), `weight` of each variable loading in the components, and name of the new variable names; and with attribute `pev` containing the proportions of explained variation.

```
summary(object, stat = MachineShop::settings("stat.Curve"), ...)

## S3 method for class 'Resample'
summary(
  object,
  stats = MachineShop::settings("stats.Resample"),
  na.rm = TRUE,
  ...
)

## S3 method for class 'TrainingStep'
summary(object, ...)
```

### Arguments

object	<a href="#">confusion</a> , <a href="#">lift</a> , trained model <a href="#">fit</a> , <a href="#">performance</a> , <a href="#">performance curve</a> , <a href="#">resample</a> , or <a href="#">rfe</a> result.
...	arguments passed to other methods.
stats	function, function name, or vector of these with which to compute summary statistics.
na.rm	logical indicating whether to exclude missing values.
.type	character string specifying that <a href="#">unMLModelFit(object)</a> be passed to <a href="#">summary</a> ("default"), <a href="#">glance</a> , or <a href="#">tidy</a> .
stat	function or character string naming a function to compute a summary statistic at each cutoff value of resampled metrics in <a href="#">PerformanceCurve</a> , or NULL for resample-specific metrics.

### Value

An object of summmary statistics.

### Examples

```
## Requires prior installation of suggested package gbm to run

## Factor response example

fo <- Species ~ .
control <- CVControl()

gbm_res1 <- resample(fo, iris, GBMModel(n.trees = 25), control)
gbm_res2 <- resample(fo, iris, GBMModel(n.trees = 50), control)
gbm_res3 <- resample(fo, iris, GBMModel(n.trees = 100), control)
summary(gbm_res3)

res <- c(GBM1 = gbm_res1, GBM2 = gbm_res2, GBM3 = gbm_res3)
summary(res)
```

SuperModel

*Super Learner Model*

---

## Description

Fit a super learner model to predictions from multiple base learners.

## Usage

```
SuperModel(
  ...,
  model = GBMModel,
  control = MachineShop::settings("control"),
  all_vars = FALSE
)
```

## Arguments

...	<a href="#">model</a> functions, function names, objects; other objects that can be <a href="#">coerced</a> to models; or vector of these to serve as base learners.
model	<a href="#">model</a> function, function name, or object defining the super model; or another object that can be <a href="#">coerced</a> to the model.
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed for the estimation of base learner weights.
all_vars	logical indicating whether to include the original predictor variables in the super model.

## Details

**Response types:** factor, numeric, ordered, Surv

## Value

SuperModel class object that inherits from MLModel.

## References

van der Laan, M. J., Polley, E. C., & Hubbard, A. E. (2007). Super learner. *Statistical Applications in Genetics and Molecular Biology*, 6(1).

predict(model_fit, newdata = ICHomes)
```

---

SurvMatrix

*SurvMatrix Class Constructors*

---

## Description

Create a matrix of survival events or probabilities.

## Usage

```
SurvEvents(data = NA, times = numeric(), distr = character())
```

```
SurvProbs(data = NA, times = numeric(), distr = character())
```

## Arguments

data	matrix, or object that can be coerced to one, with survival events or probabilities at points in time in the columns and cases in the rows.
times	numeric vector of survival times for the columns.
distr	character string specifying the survival distribution from which the matrix values were derived.

## Value

Object that is of the same class as the constructor name and inherits from `SurvMatrix`. Examples of these are predicted survival events and probabilities returned by the [predict](#) function.

## See Also

[performance](#), [metrics](#)

SurvRegModel

*Parametric Survival Model***Description**

Fits the accelerated failure time family of parametric survival models.

**Usage**

```
SurvRegModel(
  dist = c("weibull", "exponential", "gaussian", "logistic", "lognormal",
    "logloglogistic"),
  scale = 0,
  parms = list(),
  ...
)

SurvRegStepAICModel(
  dist = c("weibull", "exponential", "gaussian", "logistic", "lognormal",
    "logloglogistic"),
  scale = 0,
  parms = list(),
  ...,
  direction = c("both", "backward", "forward"),
  scope = list(),
  k = 2,
  trace = FALSE,
  steps = 1000
)
```

**Arguments**

dist	assumed distribution for y variable.
scale	optional fixed value for the scale.
parms	list of fixed parameters.
...	arguments passed to <a href="#">survreg.control</a> .
direction	mode of stepwise search, can be one of "both" (default), "backward", or "forward".
scope	defines the range of models examined in the stepwise search. This should be a list containing components upper and lower, both formulae.
k	multiple of the number of degrees of freedom used for the penalty. Only k = 2 gives the genuine AIC; k = .(log(nobs)) is sometimes referred to as BIC or SBC.
trace	if positive, information is printed during the running of stepAIC. Larger values may give more information on the fitting process.
steps	maximum number of steps to be considered.

**Details**

**Response types:** Surv

Default argument values and further model details can be found in the source See Also links below.

**Value**

MLModel class object.

---

SVMModel

*Support Vector Machine Models*

---

**Description**

Fits the well known C-svc, nu-svc, (classification) one-class-svc (novelty) eps-svr, nu-svr (regression) formulations along with native multi-class classification formulations and the bound-constraint SVM formulations.

**Usage**

```
SVMModel(  
  scaled = TRUE,  
  type = character(),  
  kernel = c("rbfdot", "polydot", "vanilladot", "tanhdot", "laplacedot", "besseldot",  
    "anovadot", "splinedot"),  
  kpar = "automatic",  
  C = 1,  
  nu = 0.2,  
  epsilon = 0.1,  
  prob.model = FALSE,  
  cache = 40,  
  tol = 0.001,  
  shrinking = TRUE
```

```

)

SVMANOVAModel(sigma = 1, degree = 1, ...)

SVMBesselModel(sigma = 1, order = 1, degree = 1, ...)

SVMLaplaceModel(sigma = numeric(), ...)

SVMLinearModel(...)

SVMPolyModel(degree = 1, scale = 1, offset = 1, ...)

SVMRadialModel(sigma = numeric(), ...)

SVMSplineModel(...)

SVMTanhModel(scale = 1, offset = 1, ...)

```

### Arguments

scaled	logical vector indicating the variables to be scaled.
type	type of support vector machine.
kernel	kernel function used in training and predicting.
kpar	list of hyper-parameters (kernel parameters).
C	cost of constraints violation defined as the regularization term in the Lagrange formulation.
nu	parameter needed for nu-svc, one-svc, and nu-svr.
epsilon	parameter in the insensitive-loss function used for eps-svr, nu-svr and eps-bsvm.
prob.model	logical indicating whether to calculate the scaling parameter of the Laplacian distribution fitted on the residuals of numeric response variables. Ignored in the case of a factor response variable.
cache	cache memory in MB.
tol	tolerance of termination criterion.
shrinking	whether to use the shrinking-heuristics.
sigma	inverse kernel width used by the ANOVA, Bessel, and Laplacian kernels.
degree	degree of the ANOVA, Bessel, and polynomial kernel functions.
...	arguments passed to SVMModel from the other constructors.
order	order of the Bessel function to be used as a kernel.
scale	scaling parameter of the polynomial and hyperbolic tangent kernels as a convenient way of normalizing patterns without the need to modify the data itself.
offset	offset used in polynomial and hyperbolic tangent kernels.

Details

- Response types:** factor, numeric
- Automatic tuning of grid parameters:**
- SVMModel: NULL
  - SVMANOVAModel: C, degree
  - SVMBesselModel: C, order, degree
  - SVMLaplaceModel: C, sigma
  - SVMLinearModel: C
  - SVMPolyModel: C, degree, scale
  - SVMRadialModel: C, sigma

The kernel-specific constructor functions SVMANOVAModel, SVMBesselModel, SVMLaplaceModel, SVMLinearModel, SVMPolyModel, SVMRadialModel, SVMSplineModel, and SVMTanhModel are special cases of SVMModel which automatically set its kernel and kpar arguments. These are called directly in typical usage unless SVMModel is needed to specify a more general model.

Default argument values and further model details can be found in the source See Also link below.

Value

MLModel class object.

```

---

t.test	<i>Paired t-Tests for Model Comparisons</i>
--------	---

---

Description

Paired t-test comparisons of resampled performance metrics from different models.

Usage

```
## S3 method for class 'PerformanceDiff'  
t.test(x, adjust = "holm", ...)
```

Arguments

- x performance [difference](#) result.
- adjust method of p-value adjustment for multiple statistical comparisons as implemented by [p.adjust](#).
- ... arguments passed to other methods.

## Details

The t-test statistic for pairwise model differences of  $R$  resampled performance metric values is calculated as

$$t = \frac{\bar{x}_R}{\sqrt{F s_R^2 / R}},$$

where  $\bar{x}_R$  and  $s_R^2$  are the sample mean and variance. Statistical testing for a mean difference is then performed by comparing  $t$  to a  $t_{R-1}$  null distribution. The sample variance in the t statistic is known to underestimate the true variances of cross-validation mean estimators. Underestimation of these variances will lead to increased probabilities of false-positive statistical conclusions. Thus, an additional factor  $F$  is included in the t statistic to allow for variance corrections. A correction of  $F = 1 + K/(K - 1)$  was found by Nadeau and Bengio (2003) to be a good choice for cross-validation with  $K$  folds and is thus used for that resampling method. The extension of this correction by Bouckaert and Frank (2004) to  $F = 1 + TK/(K - 1)$  is used for cross-validation with  $K$  folds repeated  $T$  times. For other resampling methods  $F = 1$ .

## Value

PerformanceDiffTest class object that inherits from array. p-values and mean differences are contained in the lower and upper triangular portions, respectively, of the first two dimensions. Model pairs are contained in the third dimension.

res_diff <- diff(res)
t.test(res_diff)
```

---

TreeModelClassification and Regression Tree Models

---

### Description

A tree is grown by binary recursive partitioning using the response in the specified formula and choosing splits from the terms of the right-hand-side.

### Usage

```
TreeModel(  
  mincut = 5,  
  minsize = 10,  
  mindev = 0.01,  
  split = c("deviance", "gini"),  
  k = numeric(),  
  best = integer(),  
  method = c("deviance", "misclass")  
)
```

### Arguments

mincut	minimum number of observations to include in either child node.
minsize	smallest allowed node size: a weighted quantity.
mindev	within-node deviance must be at least this times that of the root node for the node to be split.
split	splitting criterion to use.
k	scalar cost-complexity parameter defining a subtree to return.
best	integer alternative to k requesting the number of terminal nodes of a subtree in the cost-complexity sequence to return.
method	character string denoting the measure of node heterogeneity used to guide cost-complexity pruning.

### Details

**Response types:** factor, numeric

Further model details can be found in the source link below.

### Value

MLModel class object.

TunedInput	<i>Tuned Model Inputs</i>
------------	---------------------------

---

**Description**

Recipe tuning over a grid of parameter values.

**Usage**

```
TunedInput(object, ...)

## S3 method for class 'recipe'
TunedInput(
  object,
  grid = expand_steps(),
  control = MachineShop::settings("control"),
  metrics = NULL,
  cutoff = MachineShop::settings("cutoff"),
  stat = MachineShop::settings("stat.TrainingParams"),
  ...
)
```

**Arguments**

object	untrained <a href="#">recipe</a> .
...	arguments passed to other methods.
grid	RecipeGrid containing parameter values at which to evaluate a recipe, such as those returned by <a href="#">expand_steps</a> .
control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used. Recipe selection is based on the first calculated metric.
cutoff	argument passed to the metrics functions.
stat	function or character string naming a function to compute a summary statistic on resampled metric values for recipe tuning.

**Value**

TunedModelRecipe class object that inherits from TunedInput and recipe.

**See Also**

[fit](#), [resample](#), [set\\_optim](#)

**Examples**

```
library(recipes)
data(Boston, package = "MASS")

rec <- recipe(medv ~ ., data = Boston) %>%

grid <- expand_steps(
  pca = list(num_comp = 1:2)
)

fit(TunedInput(rec, grid = grid), model = GLMModel)
```

---

TunedModel	<i>Tuned Model</i>
------------	--------------------

---

**Description**

Model tuning over a grid of parameter values.

**Usage**

```
TunedModel(
  object,
  grid = MachineShop::settings("grid"),
  control = MachineShop::settings("control"),
  metrics = NULL,
  cutoff = MachineShop::settings("cutoff"),
  stat = MachineShop::settings("stat.TrainingParams")
)
```

**Arguments**

object	<a href="#">model</a> function, function name, or object defining the model to be tuned.
grid	single integer or vector of integers whose positions or names match the parameters in the model's pre-defined tuning grid if one exists and which specify the number of values used to construct the grid; <a href="#">TuningGrid</a> function, function name, or object; <a href="#">ParameterGrid</a> object; or <a href="#">data frame</a> containing parameter values at which to evaluate the model, such as that returned by <a href="#">expand_params</a> .

control	<a href="#">control</a> function, function name, or object defining the resampling method to be employed.
metrics	<a href="#">metric</a> function, function name, or vector of these with which to calculate performance. If not specified, default metrics defined in the <a href="#">performance</a> functions are used. Model selection is based on the first calculated metric.
cutoff	argument passed to the metrics functions.
stat	function or character string naming a function to compute a summary statistic on resampled metric values for model tuning.

### Details

The [expand\\_modelgrid](#) function enables manual extraction and viewing of grids created automatically when a TunedModel is fit.

**Response types:** factor, numeric, ordered, Surv

### Value

TunedModel class object that inherits from MLModel.

### See Also

[fit](#), [resample](#), [set\\_optim](#)

### Examples

```
## Requires prior installation of suggested package gbm to run
## May require a long runtime

# Automatically generated grid
model_fit <- fit(sale_amount ~ ., data = ICHomes,
                model = TunedModel(GBMModel))
varimp(model_fit)
(tuned_model <- as.MLModel(model_fit))
summary(tuned_model)
plot(tuned_model, type = "l")

# Randomly sampled grid points
fit(sale_amount ~ ., data = ICHomes,
    model = TunedModel(
      GBMModel,
      grid = TuningGrid(size = 1000, random = 5)
    ))

# User-specified grid
fit(sale_amount ~ ., data = ICHomes,
    model = TunedModel(
      GBMModel,
      grid = expand_params(
        n.trees = c(50, 100),
        interaction.depth = 1:2,
```

```

        n.minobsinnode = c(5, 10)
    )
))

```

---

TuningGrid

*Tuning Grid Control*

---

## Description

Defines control parameters for a tuning grid.

## Usage

```
TuningGrid(size = 3, random = FALSE)
```

## Arguments

size	single integer or vector of integers whose positions or names match the parameters in a model's tuning grid and which specify the number of values used to construct the grid.
random	number of unique points to sample at random from the grid defined by size. If size is a single unnamed integer, then random = Inf will include all values of all grid parameters in the constructed grid, whereas random = FALSE will include all values of default grid parameters.

## Details

Returned TuningGrid objects may be supplied to [TunedModel](#) for automated construction of model tuning grids. These grids can be extracted manually and viewed with the [expand\\_modelgrid](#) function.

## Value

TuningGrid class object.

## See Also

[TunedModel](#), [expand\\_modelgrid](#)

## Examples

```
TunedModel(XGBTreeModel, grid = TuningGrid(10, random = 5))
```

---

unMLModelFit	<i>Revert an MLModelFit Object</i>
--------------	------------------------------------

---

**Description**

Function to revert an MLModelFit object to its original class.

**Usage**

```
unMLModelFit(object)
```

**Arguments**

object                      model [fit](#) result.

**Value**

The supplied object with its MLModelFit classes and fields removed.

---

varimp	<i>Variable Importance</i>
--------	----------------------------

---

**Description**

Calculate measures of relative importance for model predictor variables.

**Usage**

```
varimp(
  object,
  method = c("permute", "model"),
  scale = TRUE,
  sort = c("decreasing", "increasing", "asis"),
  ...
)
```

**Arguments**

object	model <a href="#">fit</a> result.
method	character string specifying the calculation of variable importance as permutation-base ("permute") or model-specific ("model"). If model-specific importance is specified but not defined, the permutation-based method will be used instead with its default values (below). Permutation-based variable importance is defined as the relative change in model predictive performances between datasets with and without permuted values for the associated variable (Fisher et al. 2019).

scale	logical value or vector indicating whether importance values are scaled to a maximum of 100.
sort	character string specifying the sort order of importance values to be "decreasing", "increasing", or as predictors appear in the model formula ("asis").
...	arguments passed to model-specific or permutation-based variable importance functions. These include the following arguments and default values for method = "permute".
	select = NULL expression indicating predictor variables for which to compute variable importance (see <a href="#">subset</a> for syntax) [default: all].
	samples = 1 number of times to permute the values of each variable. Larger numbers of samples decrease variability in the estimates at the expense of increased computation time.
	prop = numeric() proportion of observations to sample without replacement at each round of variable permutations [default: all]. Subsampling of observations can decrease computation time.
	size = integer() number of observations to sample at each round of permutations [default: all].
	times = numeric() numeric vector of follow-up times at which to predict survival probabilities or NULL for predicted survival means.
	metric = NULL <a href="#">metric</a> function or function name with which to calculate performance. If not specified, the first applicable default metric from the <a href="#">performance</a> functions is used.
	compare = c("-", "/") character specifying the relative change to compute in comparing model predictive performances between datasets with and without permuted values. The choices are difference ("-") and ratio ("/").
	stats = MachineShop::settings("stat.TrainingParams") function, function name, or vector of these with which to compute summary statistics on the set of variable importance values from the permuted datasets.
	na.rm = TRUE logical indicating whether to exclude missing variable importance values from the calculation of summary statistics.
	progress = TRUE logical indicating whether to display iterative progress during computation.

## Details

The `varimp` function supports calculation of variable importance with the permutation-based method of Fisher et al. (2019) or with model-based methods where defined. Permutation-based importance is the default and has the advantages of being available for any model, any performance metric defined for the associated response variable type, and any predictor variable in the original training dataset. Conversely, model-specific importance is not defined for some models and will fall back to the permutation method in such cases; is generally limited to metrics implemented in the source packages of models; and may be computed on derived, rather than original, predictor variables. These disadvantages can make comparisons of model-specific importance across different classes of models infeasible. A downside of the permutation-based approach is increased computation time. To counter this, the permutation algorithm can be run in parallel simply by loading a parallel backend for the **foreach** package `%dopar%` function, such as **doParallel** or **doSNOW**.

Permutation variable importance is interpreted as the contribution of a predictor variable to the predictive performance of a model as measured by the performance metric used in the calculation. Importance of a predictor is conditional on and, with the default scaling, relative to the values of all other predictors in the analysis.

**Value**

VariableImportance class object.

**References**

Fisher, A., Rudin, C., & Dominici, F. (2019). All models are wrong, but many are useful: Learning a variable's importance by studying an entire class of prediction models simultaneously. *Journal of Machine Learning Research*, 20, 1-81.

XGBModel

*Extreme Gradient Boosting Models*

---

**Description**

Fits models with an efficient implementation of the gradient boosting framework from Chen & Guestrin.

**Usage**

```
XGBModel(
  nrounds = 100,
  ...,
  objective = character(),
  aft_loss_distribution = "normal",
  aft_loss_distribution_scale = 1,
  base_score = 0.5,
```

```
    verbose = 0,
    print_every_n = 1
)

XGBDARTModel(
    eta = 0.3,
    gamma = 0,
    max_depth = 6,
    min_child_weight = 1,
    max_delta_step = .(0.7 * is(y, "PoissonVariate")),
    subsample = 1,
    colsample_bytree = 1,
    colsample_bylevel = 1,
    colsample_bynode = 1,
    alpha = 0,
    lambda = 1,
    tree_method = "auto",
    sketch_eps = 0.03,
    scale_pos_weight = 1,
    refresh_leaf = 1,
    process_type = "default",
    grow_policy = "depthwise",
    max_leaves = 0,
    max_bin = 256,
    num_parallel_tree = 1,
    sample_type = "uniform",
    normalize_type = "tree",
    rate_drop = 0,
    one_drop = 0,
    skip_drop = 0,
    ...
)

XGBLinearModel(
    alpha = 0,
    lambda = 0,
    updater = "shotgun",
    feature_selector = "cyclic",
    top_k = 0,
    ...
)

XGBTreeModel(
    eta = 0.3,
    gamma = 0,
    max_depth = 6,
    min_child_weight = 1,
    max_delta_step = .(0.7 * is(y, "PoissonVariate")),
```

```

    subsample = 1,
    colsample_bytree = 1,
    colsample_bylevel = 1,
    colsample_bynode = 1,
    alpha = 0,
    lambda = 1,
    tree_method = "auto",
    sketch_eps = 0.03,
    scale_pos_weight = 1,
    refresh_leaf = 1,
    process_type = "default",
    grow_policy = "depthwise",
    max_leaves = 0,
    max_bin = 256,
    num_parallel_tree = 1,
    ...
)

```

## Arguments

nrounds	number of boosting iterations.
...	model parameters as described below and in the <a href="#">XGBoost documentation</a> and arguments passed to XGBModel from the other constructors.
objective	<p>optional character string defining the learning task and objective. Set automatically if not specified according to the following values available for supported response variable types.</p> <p>factor: "multi:softprob", "binary:logistic" (2 levels only)</p> <p>numeric: "reg:squarederror", "reg:logistic", "reg:gamma", "reg:tweedie", "rank:pairwise", "rank:ndcg", "rank:map"</p> <p>PoissonVariate: "count:poisson"</p> <p>Surv: "survival:aft", "survival:cox"</p> <p>The first values listed are the defaults for the corresponding response types.</p>
aft_loss_distribution	character string specifying a distribution for the accelerated failure time objective ("survival:aft") as "extreme", "logistic", or "normal".
aft_loss_distribution_scale	numeric scaling parameter for the accelerated failure time distribution.
base_score	initial prediction score of all observations, global bias.
verbose	numeric value controlling the amount of output printed during model fitting, such that 0 = none, 1 = performance information, and 2 = additional information.
print_every_n	numeric value designating the fitting iterations at which to print output when verbose > 0.
eta	shrinkage of variable weights at each iteration to prevent overfitting.
gamma	minimum loss reduction required to split a tree node.
max_depth	maximum tree depth.

min_child_weight	minimum sum of observation weights required of nodes.
max_delta_step, tree_method, sketch_eps, scale_pos_weight, updater, refresh_leaf, process_type, grow_policy, max_leaves, max_bin, num_parallel_tree	other tree booster parameters.
subsample	subsample ratio of the training observations.
colsample_bytree, colsample_bylevel, colsample_bynode	subsample ratio of variables for each tree, level, or split.
alpha, lambda	L1 and L2 regularization terms for variable weights.
sample_type, normalize_type	type of sampling and normalization algorithms.
rate_drop	rate at which to drop trees during the dropout procedure.
one_drop	integer indicating whether to drop at least one tree during the dropout procedure.
skip_drop	probability of skipping the dropout procedure during a boosting iteration.
feature_selector, top_k	character string specifying the feature selection and ordering method, and number of top variables to select in the "greedy" and "thrifty" feature selectors.

## Details

**Response types:** factor, numeric, PoissonVariate, Surv

**Automatic tuning of grid parameters:** • XGBModel: NULL

- XGBDARTModel: nrounds, eta\*, gamma\*, max\_depth, min\_child\_weight\*, subsample\*, colsample\_bytree\*, rate\_drop\*, skip\_drop\*
- XGBLinearModel: nrounds, alpha, lambda
- XGBTreeModel: nrounds, eta\*, gamma\*, max\_depth, min\_child\_weight\*, subsample\*, colsample\_bytree\*

\* excluded from grids by default

The booster-specific constructor functions XGBDARTModel, XGBLinearModel, and XGBTreeModel are special cases of XGBModel which automatically set the XGBoost booster **parameter**. These are called directly in typical usage unless XGBModel is needed to specify a more general model.

Default argument values and further model details can be found in the source See Also link below.

In calls to [varimp](#) for XGBTreeModel, argument type may be specified as "Gain" (default) for the fractional contribution of each predictor to the total gain of its splits, as "Cover" for the number of observations related to each predictor, or as "Frequency" for the percentage of times each predictor is used in the trees. Variable importance is automatically scaled to range from 0 to 100. To obtain unscaled importance values, set scale = FALSE. See example below.

## Value

MLModel class object.
