

# Package ‘MplusAutomation’

July 21, 2025

**Type** Package

**Title** An R Package for Facilitating Large-Scale Latent Variable Analyses in Mplus

**Version** 1.1.1

**Date** 2024-01-27

**Maintainer** Michael Hallquist <michael.hallquist@gmail.com>

**Description** Leverages the R language to automate latent variable model estimation and interpretation using 'Mplus', a powerful latent variable modeling program developed by Muthen and Muthen (<<https://www.statmodel.com>>). Specifically, this package provides routines for creating related groups of models, running batches of models, and extracting and tabulating model parameters and fit statistics.

**License** LGPL-3

**URL** <https://michaelhallquist.github.io/MplusAutomation/>

**BugReports** <https://github.com/michaelhallquist/MplusAutomation/issues>

**Depends** R (>= 3.5.0), methods

**Imports** utils, boot, plyr, gsubfn, coda, xtable, lattice, texreg, pander, digest, parallel, ggplot2, data.table, fastDummies, checkmate

**Suggests** rhdf5, tcltk, relimp, knitr, testthat (>= 3.0.0), rmarkdown

**LazyLoad** yes

**LazyData** yes

**VignetteBuilder** knitr

**RoxygenNote** 7.2.3

**Encoding** UTF-8

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Michael Hallquist [aut, cre],  
Joshua Wiley [aut],  
Caspar van Lissa [ctb],  
Daniel Morillo [ctb]

**Repository** CRAN

**Date/Publication** 2024-01-30 23:40:02 UTC

<i>.mplusMultinomial</i>	<i>Internal Function for Multinomial Regression in Mplus</i>
--------------------------	--

---

## Description

Internal Function for Multinomial Regression in Mplus

## Usage

```
.mplusMultinomial(
  dv,
  iv,
  data,
  idvar = "",
  integration = 1000,
  processors = 2,
  OR = TRUE,
  pairwise = TRUE,
  ...
)
```

## Arguments

dv	A character string with the variable name for the dependent (outcome) variable.
iv	A character vector with the variable name(s) for the independent (predictor/explanatory) variable(s).
data	A dataset.
idvar	Optional. A character string indicating the name of the ID variable. Not currently used but may be used in future.
integration	An integer indicating the number of Monte Carlo integration points to use. Defaults to 1000.
processors	An integer indicating the number of processors to use. Passed to Mplus. Defaults to 2.
OR	A logical value whether odds ratios should be returned. Defaults to TRUE.

pairwise	A logical value indicating whether all pairwise tests should be computed. Defaults to TRUE.
...	Additional arguments passed to <code>mplusModeler()</code> .

**Value**

A list of results and Mplus model object.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
## Not run:

set.seed(1234)
tmpd <- data.frame(
  x1 = rnorm(200),
  x2 = rnorm(200),
  x3 = cut(rnorm(200),
    breaks = c(-Inf, -.7, .7, Inf),
    labels = c("a", "b", "c")))
tmpd$y <- cut(rnorm(200, sd = 2) + tmpd$x1 + tmpd$x2 + I(tmpd$x3 == "b"),
  breaks = c(-Inf, -.5, 1, Inf),
  labels = c("L", "M", "H"))

tmpres <- MplusAutomation:::mplusMultinomial(
  dv = "y",
  iv = c("x1", "x2"),
  data = tmpd,
  pairwise = TRUE)
tmpres2 <- MplusAutomation:::mplusMultinomial(
  dv = "y",
  iv = c("x1", "x2"),
  data = tmpd,
  pairwise = FALSE)
tmpres3 <- MplusAutomation:::mplusMultinomial(
  dv = "y",
  iv = c("x1@0", "x2@0"),
  data = tmpd,
  pairwise = FALSE)

## End(Not run)
```

---

cd	<i>Change directory</i>
----	-------------------------

---

**Description**

The function takes a path and changes the current working directory to the path. If the directory specified in the path does not currently exist, it will be created.

**Usage**

```
cd(base, pre, num)
```

**Arguments**

base	a character string with the base path to the directory. This is required.
pre	an optional character string with the prefix to add to the base path. Non character strings will be coerced to character class.
num	an optional character string, prefixed by pre. Non character strings will be coerced to character class.

**Details**

The function has been designed to be platform independent, although it has had limited testing. Path creation is done using `file.path`, the existence of the directory is checked using `file.exists` and the directory created with `dir.create`. Only the first argument, is required. The other optional arguments are handy when one wants to create many similar directories with a common base.

**Value**

NULL, changes the current working directory

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
## Not run:
# an example just using the base
cd("~/testdir")

# an example using the optional arguments
base <- "~/testdir"
pre <- "test_"

cd(base, pre, 1)
cd(base, pre, 2)

## End(Not run)
```

---

coef.mplus.model	<i>Return coefficients for an mplus.model object</i>
------------------	--

---

### Description

This is a method for returning the coefficients of an mplus.model object. It works directly on an object stored from readModels such as: `object <- readModels("/path/to/model/model.out")`.

Method that calls `coef.mplus.model`. See further documentation there.

### Usage

```
## S3 method for class 'mplus.model'
coef(
  object,
  type = c("un", "std", "stdy", "stdyx"),
  params = c("regression", "loading", "undirected", "expectation", "variability", "new"),
  ...,
  raw = FALSE
)

## S3 method for class 'mplusObject'
coef(object, ...)
```

### Arguments

object	An object of class mplusObject
type	A character vector indicating the type of coefficients to return. One of “un”, “std”, “stdy”, or “stdyx”.
params	A character vector indicating what type of parameters to extract. Any combination of “regression”, “loading”, “undirected”, “expectation”, “variability”, and “new”. A single one can be passed or multiple. By default, all are used and all parameters are returned.
...	Additional arguments to pass on (not currently used)
raw	A logical defaulting to FALSE indicating whether to parse and return coefficients based on the type (regression, etc.) and relabel using an arrow notation, or to return the raw coefficients in a named vector.

### Value

Either a data frame of class ‘mplus.model.coefs’, or in the case of multiple group models, a list of class ‘mplus.model.coefs’, where each element of the list is a data frame of class ‘mplus.model.coefs’, or a named vector of coefficients, if `raw=TRUE`.

### Author(s)

Joshua F. Wiley <jwiley.psych@gmail.com>

```

compareModels

*Compare the output of two Mplus models***Description**

The `compareModels` function compares the output of two Mplus files and prints similarities and differences in the model summary statistics and parameter estimates. Options are provided for filtering out fixed parameters and nonsignificant parameters. When requested, `compareModels` will compute the chi-square difference test for nested models (does not apply to MLMV, WLSM, and WLSMV estimators, where DIFFTEST in Mplus is needed). Model outputs to be compared can be full summaries and parameters (generated by `readModels`), summary statistics only (`extractModelSummaries`), or parameters only (`extractModelParameters`).

**Usage**

```
compareModels(
  m1,
  m2,
  show = "all",
  equalityMargin = c(param = 1e-04, pvalue = 1e-04),
  compare = "unstandardized",
  sort = "none",
  showFixed = FALSE,
  showNS = TRUE,
  diffTest = FALSE
)
```

**Arguments**

m1	The first Mplus model to be compared. Generated by readModels, extractModelSummaries, or extractModelParameters.
m2	The second Mplus model to be compared.
show	What aspects of the models should be compared. Options are "all", "summaries", "equal", "diff", "pdiff", and "unique". See below for details.
equalityMargin	Defines the discrepancy between models that is considered equal. Different margins can be specified for p-value equality versus parameter equality. Defaults to .0001 for both.
compare	Which parameter estimates should be compared. Options are "unstandardized", "stdyx.standardized", "stdy.standardized", and "std.standardized".
sort	How to sort the output of parameter comparisons. Options are "none", "type", "alphabetical", and "maxDiff". See below for details.
showFixed	Whether to display fixed parameters in the output (identified where the est/se = 999.000, per Mplus convention). Default to FALSE.
showNS	Whether to display non-significant parameter estimates. Can be TRUE or FALSE, or a numeric value (e.g., .10) that defines what p-value is filtered as non-significant.
diffTest	Whether to compute a chi-square difference test between the models. Assumes that the models are nested. Not available for MLMV, WLSMV, and ULSMV estimators. Use DIFFTEST in Mplus instead.

**Details**

The show parameter can be one or more of the following, which can be passed as a vector, such as c("equal", "pdiff").

**show "all"** Display all available model comparison. Equivalent to c("summaries", "equal", "diff", "pdiff", "unique").

**"summaries"** Print a comparison of model summary statistics. Compares the following summary statistics (where available): c("Title", "Observations", "Estimator", "Parameters", "LL", "AIC", "BIC", "ChiSqM\_Value", "ChiSqM\_DF", "CFI", "TLI", "RMSEA", "SRMR", "WRMR")

**"allsummaries"** Prints a comparison of all summary statistics available in each model. May generate a lot of output.

**"equal"** Print parameter estimates that are equal between models (i.e.,  $\leq$  equalityMargin["param"]).

**"diff"** Print parameter estimates that are different between models (i.e.,  $>$  equalityMargin["param"]).

**"pdiff"** Print parameter estimates where the p-values differ between models (i.e.,  $>$  equalityMargin["pvalue"]).

**"unique"** Print parameter estimates that are unique to each model.

The sort parameter determines the order in which parameter estimates are displayed. The following options are available:

**sort "none"** No sorting is performed, so parameters are output in the order presented in Mplus. (Default)

**"type"** Sort parameters by their role in the model. This groups output by regression coefficient (ON), factor loadings (BY), covariances (WITH), and so on. Within each type, output is alphabetical.

**"alphabetical"** Sort parameters in alphabetical order.

**"maxDiff"** Sort parameter output by the largest differences between models (high to low).

### Value

No value is returned by this function. It is used to print model differences to the R console.

### Author(s)

Michael Hallquist

### Examples

```
# make me!!!
```

---

confint.mplus.model	<i>Return confidence intervals for an mplus.model object</i>
---------------------	--

---

### Description

This is a method for returning the confidence of an mplus.model object. It works directly on an object stored from readModels such as: object <- readModels("/path/to/model/model.out").

Method that calls confint.mplus.model. See further documentation there.

### Usage

```
## S3 method for class 'mplus.model'
confint(
  object,
  parm,
  level = 0.95,
  type = c("un", "std", "stdy", "stdyx"),
```

```

    params = c("regression", "loading", "undirected", "expectation", "variability", "new"),
    ...
)

## S3 method for class 'mplusObject'
confint(object, ...)

```

### Arguments

object	An object of class <code>mplusObject</code>
parm	Included as all <code>confint()</code> methods must include it. Not used currently for Mplus.
level	A numeric vector indicating the level of confidence interval to extract. Options are .95, .90, or .99 as those are all Mplus provides.
type	A character vector indicating the type of confidence intervals to return. One of "un", "std", "stdy", or "stdyx".
params	A character vector indicating what type of parameters to extract. Any combination of "regression", "loading", "undirected", "expectation", "variability", and "new". A single one can be passed or multiple. By default, all are used and all parameters are returned.
...	Additional arguments to pass on (not currently used)

### Value

A data frame of class 'mplus.model.cis', or in the case of multiple group models, a list of class 'mplus.model.cis', where each element of the list is a data frame of class 'mplus.model.cis'.

unlink("model1.out")
unlink("Mplus Run Models.log")

## End(Not run)

```

---

createMixtures

---

*Create syntax for a batch of mixture models*

---

## Description

Dynamically creates syntax for a batch of mixture models, with intelligent defaults. This function is a wrapper around `mplusObject` and `mplusModeler`, and the respective arguments of those functions can be passed on using `...`. For instance, passing the argument `run = 1L` means that the models will be evaluated and returned.

## Usage

```

createMixtures(
  classes = 1L,
  filename_stem = NULL,
  model_overall = NULL,
  model_class_specific = NULL,
  rdata = NULL,
  usevariables = NULL,
  OUTPUT = "TECH11 TECH14;",
  SAVEDATA = "FILE IS {filename_stem}_{C}.dat; SAVE = cprobabilities;",
  quiet = TRUE,
  ...
)

```

### Arguments

<code>classes</code>	A vector of integers, indicating which class solutions to generate. Defaults to 1L. E.g., <code>classes = 1:6</code> , <code>classes = c(1:4, 6:8)</code> .
<code>filename_stem</code>	Character. A stem for the automatically generated filenames of the syntax and data files.
<code>model_overall</code>	Character. Mplus syntax for the overall model (across classes).
<code>model_class_specific</code>	Character vector. Mplus syntax for the class-specific model(s) of one or more categorical latent variables. Each element of <code>model_class_specific</code> is used as the class-specific syntax of a different categorical latent variable. This allows one to easily specify latent transition analyses (see second example). The character string “{C}” is substituted with the correct class number, for example to set unique parameter labels for each class, or to specify equality constraints.
<code>rdata</code>	Data.frame. An R dataset to be used for the model.
<code>usevariables</code>	Character vector, specifying the names of variables in the <code>rdata</code> object which should be included in the Mplus data file and model.
<code>OUTPUT</code>	Character. Syntax for Mplus’ OUTPUT option. Highly recommended when determining the appropriate number of latent classes. TECH11 is required to obtain the VLMR-test; TECH14 is required for the BLR-test.
<code>SAVEDATA</code>	Character. Syntax for Mplus’ savedata option. Highly recommended when conducting mixture models. The default option will often be adequate.
<code>quiet</code>	optional. If TRUE, show status messages in the console.
<code>...</code>	Additional arguments, passed to <a href="#">mplusObject</a> , such as syntax for other Mplus options.

### Details

In the arguments `model_class_specific` and `SAVEDATA`, the character string “{C}” is substituted with the correct class number. The character string “{filename\_stem}” is substituted with the file-name stem, for example, to name savedata in line with the input files.

In all arguments to `mplusObject`, a double space (“ ”) is replaced with a newline character. This can be used to obtain nicely formatted Mplus syntax.

### Value

None, unless the argument `run = 1L` is specified. In that case, a list with elements of class `mplusObject` is returned. Otherwise, this function is used for its side effects (generating syntax).

## Examples

```
## Not run:
createMixtures(classes = 1:3, filename_stem = "iris", rdata = iris)

## End(Not run)
## Not run:
mydat <- read.csv(
  system.file("extdata", "ex8.13.csv", package = "MplusAutomation"))
createMixtures(
  classes = 2,
  filename_stem = "dating",
  model_overall = "c2 ON c1;",
  model_class_specific = c(
    "[u11$1] (a{C}); [u12$1] (b{C}); [u13$1] (c{C}); [u14$1] (d{C}); [u15$1] (e{C});",
    "[u21$1] (a{C}); [u22$1] (b{C}); [u23$1] (c{C}); [u24$1] (d{C}); [u25$1] (e{C});"
  ),
  rdata = mydat,
  ANALYSIS = "PROCESSORS IS 2; LRTSTARTS (0 0 40 20); PARAMETERIZATION = PROBABILITY;",
  VARIABLE = "CATEGORICAL = u11-u15 u21-u25;"
)

## End(Not run)
```

---

createModels

---

*Create Mplus Input Files from Template*

---

## Description

The createModels function processes a single Mplus template file and creates a group of related model input files. Definitions and examples for the template language are provided in the MplusAutomation vignette and are not duplicated here at the moment. See this documentation: `vignette("Vignette", package="MplusAutomation")`

## Usage

```
createModels(templatefile)
```

## Arguments

**templatefile** The filename (absolute or relative path) of an Mplus template file to be processed. Example "C:/MplusTemplate.txt"

## Value

No value is returned by this function. It is solely used to process an Mplus template file.

## Author(s)

Michael Hallquist

**Examples**

```
## Not run:
  createModels("L2 Multimodel Template No iter.txt")

## End(Not run)
```

---

createSyntax

---

*Create the Mplus input text for an mplusObject*

---

**Description**

This function takes an object of class `mplusObject` and creates the Mplus input text corresponding to it, including data link and variable names.

**Usage**

```
createSyntax(object, filename, check = TRUE, add = FALSE, imputed = FALSE)
```

**Arguments**

<code>object</code>	An object of class <code>mplusObject</code>
<code>filename</code>	The name of the data file as a character vector
<code>check</code>	A logical indicating whether or not to run <code>parseMplus</code> on the created input file. Checks for errors like lines that are too long, or for missing semi-colons and gives notes.
<code>add</code>	A logical passed on to <code>parseMplus</code> whether to add semi colons to line ends. Defaults to FALSE.
<code>imputed</code>	A logical whether the data are multiply imputed. Defaults to FALSE.

**Value**

A character string containing all the text for the Mplus input file.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**See Also**

[prepareMplusData](#), [mplusModeler](#)

**Examples**

```
# example mplusObject
example1 <- mplusObject(MODEL = "mpg ON wt;",
  usevariables = c("mpg", "hp"), rdata = mtcars)

# create the Mplus input text
cat(createSyntax(example1, "example1.dat"), file=stdout(), fill=TRUE)

# update the object, then create input text
cat(createSyntax(update(example1,
  TITLE = ~ "This is my title;",
  MODEL = ~ . + "\nmpg ON hp;",
  usevariables = c("mpg", "hp", "wt")), "example1.dat"),
  file=stdout(),
  fill=TRUE)
rm(example1)
```

detectMplus

*Detect the location/name of the Mplus command***Description**

This is an utility function to help detect the correct name/path to Mplus. It tries hard across operating systems to find Mplus and if it cannot find the full version of Mplus to find a demo version of Mplus.

**Usage**

```
detectMplus()
```

**Details**

It does not require any arguments.

**Value**

A character string that is the Mplus command possibly the path to the mplus command or an error if it cannot be found.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
## if you have Mplus installed, uncomment and run
## this will give an error if it cannot find Mplus.
## detectMplus()
```

---

detectVariables	<i>Automatically detect variables from an Mplus model object</i>
-----------------	--

---

## Description

This is a function to automatically detect the variables used in an Mplus model object.

## Usage

```
detectVariables(object, quiet = TRUE)
```

## Arguments

object	An Mplus model object from <code>mplusObject.#</code>
quiet	optional. If TRUE, show status messages in the console.

## Value

A vector of variables from the R dataset to use.

## Author(s)

Joshua F. Wiley <jwiley.psych@gmail.com>

## See Also

[mplusModeler](#), [mplusObject](#)

## Examples

```
example1 <- mplusObject(MODEL = "mpg ON wt;",  
  rdata = mtcars, autov = FALSE)  
example1$usevariables  
MplusAutomation::detectVariables(example1)  
  
example2 <- mplusObject(MODEL = "mpg ON wt;",  
  rdata = mtcars, autov = TRUE)  
example2$usevariables  
example3 <- update(example2,  
  MODEL = ~ . + "mpg ON qsec; wt WITH qsec;",  
  autov = TRUE)  
example3$usevariables  
rm(example1, example2, example3)
```

---

extract

---

*Extract function to make Mplus output work with the **texreg** package*

---

## Description

This is a method for extracting output in a format suitable for the **texreg** package. Uses `coef` for most the work.

## Usage

```
extract.mplus.model(
  model,
  summaries = "none",
  cis = FALSE,
  escape.latex = FALSE,
  ...
)

extract.mplusObject(model, summaries = "none", cis = FALSE, ...)

## S4 method for signature 'mplus.model'
extract(model, summaries = "none", cis = FALSE, escape.latex = FALSE, ...)

## S4 method for signature 'mplusObject'
extract(model, summaries = "none", cis = FALSE, ...)
```

## Arguments

<code>model</code>	An Mplus model object. This typically comes either from <a href="#">readModels</a> directly, or indirectly via <a href="#">mplusModeler</a> . The results will have different classes, but <code>extract</code> methods are defined for both.
<code>summaries</code>	A character vector which summaries to include. Defaults to “none”.
<code>cis</code>	A logical whether to extract confidence intervals.
<code>escape.latex</code>	A logical value whether to escape dollar signs in coefficient names for LaTeX. Defaults to FALSE.
<code>...</code>	Additional arguments passed to <a href="#">coef.mplus.model</a> .

## Value

A `texreg` object, or for multiple group models, a list of `texreg` objects.

## Author(s)

Joshua F. Wiley <jwiley.psych@gmail.com>

## End(Not run)
```

**Description**

Extract the model parameters from an EFA Mplus model output

**Usage**

```
extractEFAparameters(outfiletext, filename)
```

**Arguments**

outfiletext	character vector of Mplus output file being processed
filename	name of the output file

**Value**

list of parsed EFA parameters

---

```
extractModelParameters
```

*Extract model parameters from MODEL RESULTS section.*

---

**Description**

Extracts the model parameters from the MODEL RESULTS section of one or more Mplus output files. If a particular output file has more than one results section (unstandardized, stdyx, stdy, and/or std), a list will be returned. If the target is a directory, all .out files therein will be parsed and a single list will be returned, where the list elements are named by the output file name. Returned parameters often include the parameter estimate, std. err, param/s.e., and two-tailed p-value.

**Usage**

```
extractModelParameters(
  target = getwd(),
  recursive = FALSE,
  filefilter,
  dropDimensions = FALSE,
  resultType
)
```

**Arguments**

target	the directory containing Mplus output files (.out) to parse OR the single output file to be parsed. May be a full path, relative path, or a filename within the working directory. Defaults to the current working directory. Example: "C:/Users/Michael/Mplus Runs"
recursive	optional. If TRUE, parse all models nested in subdirectories within target. Defaults to FALSE.

filefilter	a Perl regular expression (PCRE-compatible) specifying particular output files to be parsed within directory. See regex or <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for details about regular expression syntax.
dropDimensions	Relevant only for multi-file parsing. If TRUE, then if only one output section (usually unstandardized) is present for all files in the parsed list, then eliminate the second-level list (which contains elements for each output section). The result is that the elements of the returned list are <code>data.frame</code> objects with the relevant parameters.
resultType	N.B.: this parameter is deprecated and will be removed in a future version. The new default is to extract all results that are present and return a list (see below for details). <code>resultType</code> specified the results section to extract. If <code>raw</code> , the unstandardized estimates will be returned. “stdyx”, “stdy”, and “std” are the other options, which extract different standardized solutions. See the Mplus User’s Guide for additional details about the differences in these standardizations.

## Value

If `target` is a single file, a list containing unstandardized and standardized results will be returned. If all standardized solutions are available, the list element will be named: `unstandardized`, `stdyx.standardized`, `stdy.standardized`, and `std.standardized`. If confidence intervals are output using `OUTPUT:CINTERVAL`, then a list element named `ci.unstandardized` will be included. Each of these list elements is a `data.frame` containing relevant model parameters.

If `target` is a directory, a list will be returned, where each element contains the results for a single file, and the top-level elements are named after the corresponding output file name. Each element within this list is itself a list, with elements as in the single file case above.

The core `data.frame` for each MODEL RESULTS section typically has the following structure:

paramHeader	The header that begins a given parameter set. Example: "FACTOR1 BY"
param	The particular parameter being measured (within paramHeader). Example: "ITEM1"
est	Parameter estimate value.
se	Standard error of the estimate
est_se	Quotient of <code>est/se</code> , representing z-test/t-test in large samples
pval	Two-tailed p-value for the <code>est_se</code> quotient.

In the case of output from Bayesian estimation (`ESTIMATOR=BAYES`), the `data.frame` will contain a different set of variables, including some of the above, as well as

posterior_sd	Posterior standard deviation of the estimate.
lower_2.5ci	Lower 2.5 percentile of the estimate.
upper_2.5ci	Upper 2.5 percentile (aka 97.5 percentile) of the estimate.

Also note that the `pval` column for Bayesian output represents a one-tailed estimate.

In the case of output from a Monte Carlo study (`MONTECARLO:` and `MODEL POPULATION:`), the `data.frame` will contain a different set of variables, including some of the above, as well as

population	Population parameter value.
------------	-----------------------------

average	Average parameter estimate across replications.
population_sd	Standard deviation of parameter value in population across replications.
average_se	Average standard error of estimated parameter value across replications.
mse	Mean squared error.
cover_95	Proportion of replications whose 95% confidence interval for the parameter includes the population value.
pct_sig_coef	Proportion of replications for which the two-tailed significance test of the parameter is significant ( $p < .05$ ).

In the case of confidence interval output (OUTPUT:CINTERVAL), the list element `ci.unstandardized` will contain a different set of variables, including some of the above, as well as

low.5	Lower 0.5% CI estimate.
low2.5	Lower 2.5% CI estimate.
low5	Lower 5% CI estimate.
est	Parameter estimate value.
up5	Upper 5% (i.e., 95%) CI estimate.
up2.5	Upper 2.5% (i.e., 97.5%) CI estimate.
up.5	Upper 0.5% (i.e., 99.5%) CI estimate.

If the model contains multiple latent classes, an additional variable, `LatentClass`, will be included, specifying the latent class number. Also, the Categorical Latent Variables section will be included as `LatentClass "Categorical.Latent.Variables."`

If the model contains multiple groups, `Group` will be included.

If the model contains two-level output (between/within), `BetweenWithin` will be included.

```

---

`extractModelSummaries` *Extract summary statistics from a single output file or from a group of Mplus models within a directory*

---

## Description

Parses a group of Mplus model output files (.out extension) for model fit statistics. At this time, the details extracted are fixed and include: Filename, InputInstructions, Title, Estimator, LL, BIC, aBIC, AIC, AICC, Parameters, Observations, CFI, TLI, RMSEA\_Estimate, RMSEA\_90CI\_LB, RMSEA\_90CI\_UB, RMSEA\_pLT05, ChiSqM\_Value, ChiSqM\_DF, ChiSq\_PValue, BLRT\_KM1LL, BLRT\_PValue, BLRT\_Numdraws). The infrastructure is in place to allow for user-specified selection of summary statistics in future versions.

## Usage

```
extractModelSummaries(target = getwd(), recursive = FALSE, filefilter)
```

## Arguments

<code>target</code>	the directory containing Mplus output files (.out) to parse OR the single output file to be parsed. Defaults to the current working directory. Example: "C:/Users/Michael/Mplus Runs"
<code>recursive</code>	optional. If TRUE, parse all models nested in subdirectories within directory. Defaults to FALSE.
<code>filefilter</code>	a Perl regular expression (PCRE-compatible) specifying particular output files to be parsed within directory. See regex or <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for details about regular expression syntax.

## Value

Returns a `data.frame` containing model fit statistics for all output files within directory. The `data.frame` contains some of the following variables (depends on model type):

Title	Title for the model, specified by the TITLE: command
Filename	Filename of the output file
Estimator	Estimator used for the model (e.g., ML, MLR, WLSMV, etc.)
LL	Log-likelihood of the model
BIC	Bayesian Information Criterion
aBIC	Sample-Size-Adjusted BIC (Sclove, 1987)
AIC	Akaike's Information Criterion
AICC	Corrected AIC, based on Sugiura (1978) and recommended by Burnham & Anderson (2002)
DIC	Deviance Information Criterion. Available in ESTIMATOR=BAYES output.
Parameters	Number of parameters estimated by the model

pD	Estimated number of parameters in Bayesian output
Observations	The number of observations for the model (does not support multiple-groups analysis at this time)
CFI	Confirmatory Fit Index
TLI	Tucker-Lewis Index
RMSEA_Estimate	Point estimate of root mean squared error of approximation
RMSEA_90CI_LB	Lower bound of the 90% Confidence Interval around the RMSEA estimate.
RMSEA_90CI_UB	Upper bound of the 90% Confidence Interval around the RMSEA estimate.
RMSEA_pLT05	Probability that the RMSEA estimate falls below .05, indicating good fit.
ChiSqM_Value	Model chi-squared value
ChiSqM_DF	Model chi-squared degrees of freedom
ChiSqM_PValue	Model chi-squared p value
ChiSqM_ScalingCorrection	H0 Scaling Correction Factor
ObsRepChiSqDiff_95CI_LB	Lower bound of 95% confidence interval for the difference between observed and replicated chi-square values
ObsRepChiSqDiff_95CI_UB	Upper bound of 95% confidence interval for the difference between observed and replicated chi-square values
PostPred_PValue	Posterior predictive p-value
PriorPostPred_PValue	Prior Posterior Predictive P-Value
BLRT_RequestedDraws	Number of requested bootstrap draws for TECH14.
BLRT_KM1LL	Log-likelihood of the K-1 model (one less class) for the Bootstrapped Likelihood Ratio Test (TECH14).
BLRT_2xLLDiff	Two times the log-likelihood difference of the models with K and K-1 classes (TECH14).
BLRT_ParamDiff	Difference in the number of parameters for models with K and K-1 classes (TECH14).
BLRT_PValue	P-value of the Bootstrapped Likelihood Ratio Test (TECH14) testing whether the K class model is significantly better than K-1
BLRT_SuccessfulDraws	The number of successful bootstrapped samples used in the Bootstrapped Likelihood Ratio Test
SRMR	Standardized root mean square residual
SRMR.Between	For TYPE=TWOLEVEL output, standardized root mean square residual for between level
SRMR.Within	For TYPE=TWOLEVEL output, standardized root mean square residual for within level

WRMR	Weighted root mean square residual
ChiSqBaseline_Value	Baseline (unstructured) chi-squared value
ChiSqBaseline_DF	Baseline (unstructured) chi-squared degrees of freedom
ChiSqBaseline_PValue	Baseline (unstructured) chi-squared p value
NumFactors	For TYPE=EFA output, the number of factors
T11_KM1Starts	TECH11: Number of initial stage random starts for k-1 model
T11_KM1Final	TECH11: Number of final stage optimizations for k-1 model
T11_KM1LL	TECH11: Log-likelihood of the K-1 model used for the Vuong-Lo-Mendell-Rubin LRT
T11_VLMR_2xLLDiff	TECH11: 2 * Log-likelihood Difference of K-class vs. K-1-class model for the Vuong-Lo-Mendell-Rubin LRT
T11_VLMR_ParamDiff	TECH11: Difference in number of parameters between K-class and K-1-class model for the Vuong-Lo-Mendell-Rubin LRT
T11_VLMR_Mean	TECH11: Vuong-Lo-Mendell-Rubin LRT mean
T11_VLMR_SD	TECH11: Vuong-Lo-Mendell-Rubin LRT standard deviation
T11_VLMR_PValue	TECH11: Vuong-Lo-Mendell-Rubin LRT p-value
T11_LMR_Value	TECH11: Lo-Mendell-Rubin Adjusted LRT value
T11_LMR_PValue	TECH11: Lo-Mendell-Rubin Adjusted LRT p-value

---

extractModIndices	<i>Extract model modification indices.</i>
-------------------	--

---

### Description

Extracts the model modification indices from the MODEL MODIFICATION INDICES section of one or more Mplus output files. If the `target` is a directory, all .out files therein will be parsed and a single list will be returned, where the list elements are named by the output file name. Returned parameters typically include the pairwise relationships between variables to be freed, the change in model chi-square (M.I.), and the expected parameter change (E.P.C.).

### Usage

```
extractModIndices(target = getwd(), recursive = FALSE, filefilter)
```

### Arguments

<code>target</code>	the directory containing Mplus output files (.out) to parse OR the single output file to be parsed. May be a full path, relative path, or a filename within the working directory. Defaults to the current working directory. Example: "C:/Users/Michael/Mplus Runs"
<code>recursive</code>	optional. If TRUE, parse all models nested in subdirectories within <code>target</code> . Defaults to FALSE.
<code>filefilter</code>	a Perl regular expression (PCRE-compatible) specifying particular output files to be parsed within directory. See <code>regex</code> or <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for details about regular expression syntax.

### Value

If `target` is a single file, a `data.frame` containing modification results for the target output file will be returned. If `target` is a directory, a list will be returned, where each element contains a `data.frame` of the modification indices for a single file, and the top-level elements are named after the corresponding output file name. The basic `data.frame` containing the MODEL MODIFICATION INDICES section of `outfile`. Variables include

<code>modV1</code>	The first variable in the pair to be freed according to the M.I.
<code>operator</code>	The suggested relationship between <code>modV1</code> and <code>modV2</code> (e.g., WITH for freeing the covariance between <code>modV1</code> and <code>modV2</code> )
<code>modV2</code>	The first variable in the pair to be freed according to the M.I.
<code>MI</code>	The decrease in model chi-square if the specified relationship is freely estimated
<code>EPC</code>	The expected parameter estimate between <code>modV1</code> and <code>modV2</code> if freed.
<code>Std_EPC</code>	The EPC value standardized using the variances of the continuous latent variables.
<code>StdYX_EPC</code>	The EPC value standardized using the variances of the continuous latent variables as well as the variances of the background and/or outcome variables.

---

getSavedata_Bparams	<i>Load the draws from the Bayesian model posterior distribution (SAVE-DATA BPARAMETERS) command into an R data.frame</i>
---------------------	---

---

**Description**

This function reads a the BPARAMETERS output file from the Mplus SAVEDATA BPARAMETERS command and returns an R data.frame object.

**Usage**

```
getSavedata_Bparams(outfile, discardBurnin = TRUE)
```

**Arguments**

outfile	Required. The name of the Mplus output file to read. Can be an absolute or relative path. If outfile is a relative path or just the filename, then it is assumed that the file resides in the working directory getwd().
discardBurnin	Optional. Whether to discard the burn-in phase of each MCMC chain (i.e., the first half).

**Value**

A list containing the draws from the MCMC chains for a Bayesian model that uses the SAVE-DATA BPARAMETERS command. Each list element corresponds to a single MCMC chain, as specified by the ANALYSIS: CHAINS syntax in Mplus. If discardBurnin is FALSE, then a superordinate list is provided that divides output in terms of burn-in versus valid draw halves of the MCMC chains. For documentation of how Mplus implements chain convergence checks and MCMC draws, see here: <http://www.statmodel.com/download/Bayes3.pdf>.

**Note**

Note that the `outfile` parameter should refer to the Mplus output file (.out extension), not the actual dataset generated by SAVEDATA. This function reads information about the dataset from the .out file and loads the dataset accordingly.

---

getSavedata_Data	<i>Load an analysis dataset from the SAVEDATA command into an R data.frame</i>
------------------	--

---

**Description**

This function reads an analysis dataset generated by the Mplus SAVEDATA command and returns an R `data.frame` object.

**Usage**

```
getSavedata_Data(outfile)
```

**Arguments**

outfile	Required. The name of the Mplus output file to read. Can be an absolute or relative path. If <code>outfile</code> is a relative path or just the filename, then it is assumed that the file resides in the working directory <code>getwd()</code> .
---------	---

**Value**

A `data.frame` containing the analysis dataset generated by the SAVEDATA command.

**Note**

Note that the `outfile` parameter should refer to the Mplus output file (.out extension), not the actual dataset generated by SAVEDATA. This function reads information about the dataset from the .out file and loads the dataset accordingly.

`getSavedata_Fileinfo`    *Read Variable Names, Formats, and Widths from data generated by the SAVEDATA Command*

---

**Description**

This function reads the SAVEDATA INFORMATION section from an Mplus output file that used the SAVEDATA command, and it returns a list with the filename, variable names, variable formats, and variable widths of the SAVEDATA file. If present, the function also parses information about the Bayesian Parameters (BPARAMETERS) file.

**Usage**

```
getSavedata_Fileinfo(outfile)
```

**Arguments**

<code>outfile</code>	required. The name of the Mplus output file to read. Can be an absolute or relative path. If <code>outfile</code> is a relative path or just the filename, then it is assumed that the file resides in the working directory <code>getwd()</code> .
----------------------	---

**Value**

Returns a list of SAVEDATA file information that includes:

<code>fileName</code>	The name of the file containing the analysis dataset created by the Mplus SAVEDATA command.
<code>fileVarNames</code>	A character vector containing the names of variables in the dataset.

fileVarFormats	A character vector containing the Fortran-style formats of variables in the dataset.
fileVarWidths	A numeric vector containing the widths of variables in the dataset (which is stored in fixed-width format).
bayesFile	The name of the BPARAMETERS file containing draws from the posterior distribution created by the Mplus SAVEDATA BPARAMETERS command.
bayesVarNames	A character vector containing the names of variables in the BPARAMETERS dataset.
tech3File	A character vector of the tech 3 output.
tech4File	A character vector of the tech 4 output.

get\_results

---

*Extract Mplus results*

---

**Description**

This function allows users to extract elements of Mplus output by name from different types of objects returned by MplusAutomation.

**Usage**

```
get_results(x, element, simplify = FALSE, ...)

get_input(x, simplify = FALSE, ...)

get_warn_err(x, simplify = FALSE, ...)

get_data_summary(x, simplify = FALSE, ...)

get_sampstat(x, simplify = FALSE, ...)

get_covariance_coverage(x, simplify = FALSE, ...)
```

```
get_summaries(x, simplify = FALSE, ...)
get_invariance_testing(x, simplify = FALSE, ...)
get_parameters(x, simplify = FALSE, ...)
get_class_counts(x, simplify = FALSE, ...)
get_indirect(x, simplify = FALSE, ...)
get_mod_indices(x, simplify = FALSE, ...)
get_residuals(x, simplify = FALSE, ...)
get_savedata(x, simplify = FALSE, ...)
get_bparameters(x, simplify = FALSE, ...)
get_tech1(x, simplify = FALSE, ...)
get_tech3(x, simplify = FALSE, ...)
get_tech4(x, simplify = FALSE, ...)
get_tech7(x, simplify = FALSE, ...)
get_tech8(x, simplify = FALSE, ...)
get_tech9(x, simplify = FALSE, ...)
get_tech10(x, simplify = FALSE, ...)
get_tech12(x, simplify = FALSE, ...)
get_tech15(x, simplify = FALSE, ...)
get_fac_score_stats(x, simplify = FALSE, ...)
get_lcCondMeans(x, simplify = FALSE, ...)
get_gh5(x, simplify = FALSE, ...)
```

### Arguments

x	Object from which to extract results.
element	Which element of the results to extract.
simplify	Logical; should the result be simplified to a vector, matrix or higher dimensional

array if possible? See [sapply](#). Defaults to FALSE.

... Additional arguments passed to and from functions.

## Value

An atomic vector or matrix or list of the same length as X (of length n for replicate). If simplification occurs, the output type is determined from the highest type of the return values in the hierarchy NULL < raw < logical < integer < double < complex < character < list < expression, after coercion of pairlists to lists.

## Examples

```

out <- get_gh5(res)
```

---

HTMLSummaryTable	<i>Create an HTML file containing a summary table of Mplus model statistics</i>
------------------	---

---

### Description

Creates an HTML file containing a summary table of model fit statistics extracted using the `extractModelSummaries` function. By default, the following summary statistics are included: Title, LL, Parameters, AIC, AICC, BIC, RMSEA\_Estimate, but these are customizable using the `keepCols` and `dropCols` parameters.

### Usage

```
HTMLSummaryTable(
  modelList,
  filename = file.path(getwd(), "Model Comparison.html"),
  keepCols,
  dropCols,
  sortBy = NULL,
  display = FALSE
)
```

### Arguments

<code>modelList</code>	A list of models (as a <code>data.frame</code> ) returned from the <code>extractModelSummaries</code> function.
<code>filename</code>	The name of the HTML file to be created. Can be an absolute or relative path. If <code>filename</code> is a relative path or just the filename, then it is assumed that the file resides in the working directory <code>getwd()</code> . Example: "Mplus Summary.html"
<code>keepCols</code>	A vector of character strings indicating which columns/variables to display in the summary. Only columns included in this list will be displayed (all others excluded). By default, <code>keepCols</code> is: <code>c("Title", "LL", "Parameters", "AIC", "AICC", "BIC", "RMSEA_Estimate")</code> . Example: <code>c("Title", "LL", "AIC", "CFI")</code>
<code>dropCols</code>	A vector of character strings indicating which columns/variables to omit from the summary. Any column not included in this list will be displayed. By default, <code>dropCols</code> is <code>NULL</code> . Example: <code>c("InputInstructions", "TLI")</code>
<code>sortBy</code>	optional. Field name (as character string) by which to sort the table. Typically an information criterion (e.g., "AIC" or "BIC") is used to sort the table. Defaults to <code>NULL</code> , which does not sort the table.
<code>display</code>	optional. This parameter specifies whether to display the table in a web browser upon creation ( <code>TRUE</code> or <code>FALSE</code> ).

### Value

No value is returned by this function. It is solely used to create an HTML file containing summary statistics.

**Note**

You must choose between `keepCols` and `dropCols` because it is not sensible to use these together to include and exclude columns. The function will error if you include both parameters.

**Examples**

```
# make me!!!
```

---

LatexSummaryTable	<i>Display summary table of Mplus model statistics in separate window</i>
-------------------	---

---

**Description**

Creates a LaTeX-formatted summary table of model fit statistics extracted using the `extractModelSummaries` function. The table syntax is returned by the function, which is useful for embedding LaTeX tables using Sweave. By default, the following summary statistics are included: Title, LL, Parameters, AIC, AICC, BIC, RMSEA\_Estimate, but these are customizable using the `keepCols` and `dropCols` parameters.

**Usage**

```
LatexSummaryTable(
  modelList,
  keepCols,
  dropCols,
  sortBy = NULL,
  label = NULL,
  caption = NULL
)
```

**Arguments**

<code>modelList</code>	A list of models (as a <code>data.frame</code> ) returned from the <code>extractModelSummaries</code> function.
<code>keepCols</code>	A vector of character strings indicating which columns/variables to display in the summary. Only columns included in this list will be displayed (all others excluded). By default, <code>keepCols</code> is: <code>c("Title", "LL", "Parameters", "AIC", "AICC", "BIC", "RMSEA_Estimate")</code> . Example: <code>c("Title", "LL", "AIC", "CFI")</code>

dropCols	A vector of character strings indicating which columns/variables to omit from the summary. Any column not included in this list will be displayed. By default, dropCols is NULL. Example: c("InputInstructions", "TLI")
sortBy	optional. Field name (as character string) by which to sort the table. Typically an information criterion (e.g., "AIC" or "BIC") is used to sort the table. Defaults to NULL, which does not sort the table.
label	optional. A character string specifying the label for the LaTeX table, which can be used for referencing the table.
caption	optional. A character string specifying the caption for the LaTeX table.

**Value**

A LaTeX-formatted table summarizing the modelList is returned (created by xtable).

**Note**

You must choose between keepCols and dropCols because it is not sensible to use these together to include and exclude columns. The function will error if you include both parameters.

---

long2LGMM

---

*Long data to wide latent growth mixture model*

---

**Description**

This function streamlines the process of converting long data into a format that Mplus can use for latent growth mixture models in wide form. It makes use of continuous time scores, and these time scores must be supplied as variables in the R dataset. For the conversion to wide form, it is assumed that although assessments may have happened in continuous time, a discrete number of assessments (likely ismilar for all participants) were collected.

**Usage**

```
long2LGMM(
  data,
  idvar,
  assessmentvar,
  dv,
  timevars,
  misstrick = TRUE,
  k = 1L,
  title = "Trajectory Model",
  base = "trajmodel_",
  run = FALSE,
  processors = 1L,
  starts = "500 100",
  newdata,
  cov = c("un", "independent", "intercept", "zero"),
  model
)
```

## Arguments

<code>data</code>	A data frame in long format (i.e., multiple rows per ID).
<code>idvar</code>	A character string of the variable name in the dataset that is the ID variable.
<code>assessmentvar</code>	A character string of the variable name in the dataset that indicates the particular assessment point for each timepoint.
<code>dv</code>	A character string of the dependent variable name.
<code>timevars</code>	A character vector of the time variables. Can be a single variable or more than one. By allowing more than one variable, it is easy to include linear; linear and quadratic; it is also possible to calculate splines in R and pass these. The variable names should be 7 characters or fewer, each.
<code>misstrick</code>	A logical value whether to set values of the DV where a time variable is missing to missing as well. Defaults to TRUE.
<code>k</code>	An integer indicating the number of distinct classes to test. Currently must be greater than 0 and less than 10.
<code>title</code>	A character string giving a title for the model
<code>base</code>	A character string providing a base name for model outputs, that is combined with the number of classes.
<code>run</code>	A logical value whether or not to run the models or only create the data and input files, but not run them.
<code>processors</code>	An integer value indicating the number of processors to use.
<code>starts</code>	A character string passed to Mplus providing the number of random starts and iterations
<code>newdata</code>	A data frame of new values to use for generating predicted trajectories by class.
<code>cov</code>	A character string indicating the random covariance structure to use
<code>model</code>	An optional argument, can pass an existing model, the output from <code>mplusModeler()</code> .

## Details

One valuable feature of this function is that it makes it possible to feed any continuous time scores to Mplus for mixture modelling. For example, continuous linear time is straightforward, but so to are quadratic time models or piecewise models. Using facilities in R, spline models are also comparatively easy to specify.

## Examples

```
## Not run:
## Simulate Some Data from 3 classes
library(MASS)
set.seed(1234)
allcoef <- rbind(
  cbind(1, mvrnorm(n = 200,
                    mu = c(0, 2, 0),
                    Sigma = diag(c(.2, .1, .01)),
                    empirical = TRUE)),
```

```

cbind(2, mvrnorm(n = 200,
                 mu = c(-3.35, 2, 2),
                 Sigma = diag(c(.2, .1, .1)),
                 empirical = TRUE)),
cbind(3, mvrnorm(n = 200,
                 mu = c(3.35, 2, -2),
                 Sigma = diag(c(.2, .1, .1)),
                 empirical = TRUE)))

  newdata = nd,
  cov = tuneGrid$cov[1])

rm(mres)

## End(Not run)

```

---

lookupTech1Parameter    *Lookup the matrix element for a give parameter number*

---

## Description

The lookupTech1Parameter function identifies the position in the Mplus model matrices corresponding to a given parameter defined in the TECHNICAL 1 PARAMETER SPECIFICATION OUTPUT. The goal of this function is to aid in identifying problematic parameters often printed in the warnings and errors section of Mplus output.

## Usage

```
lookupTech1Parameter(tech1Output, paramNumber)
```

**Arguments**

tech1Output	The object corresponding to the TECH1 parameter specification from readModels.
paramNumber	The parameter number to lookup

**Value**

A data.frame containing the row(s) and column(s) of TECH1 parameter specification matching the requested paramNumber.

**Author(s)**

Michael Hallquist

**See Also**

[readModels](#)

**Examples**

```
## Not run:
models <- readModels("test1.out")
param <- lookupTech1Parameter(models$tech1, 16)

## End(Not run)
```

---

mixtureSummaryTable	<i>Create a summary table of Mplus mixture models</i>
---------------------	---

---

**Description**

Creates a summary table of model fit statistics and relevant diagnostic information for a list of mixture models. Default statistics reported are in line with published guidelines (see Jung & Wickrama, 2008; Nylund et al., 2007): c("Title", "Classes", "Warnings", "AIC", "BIC", "aBIC", "Entropy", "T11\_VLMR\_PValue", "T11\_LMR\_PValue", "BLRT\_PValue", "min\_N", "max\_N", "min\_prob", "max\_prob"). The table is customizable using the keepCols parameter, which is passed through to [SummaryTable](#).

**Usage**

```
mixtureSummaryTable(
  modellist,
  keepCols = c("Title", "Classes", "Warnings", "AIC", "BIC", "aBIC", "Entropy",
    "T11_VLMR_PValue", "T11_LMR_PValue", "BLRT_PValue", "min_N", "max_N", "min_prob",
    "max_prob"),
  sortBy = NULL,
  ...
)
```

**Arguments**

<code>modellist</code>	A list of models returned from the <code>extractModelSummaries</code> function.
<code>keepCols</code>	A vector of character strings indicating which columns/variables to display in the summary. Only columns included in this list will be displayed (all others excluded). By default, <code>keepCols</code> is: <code>c("Title", "Classes", "Warnings", "AIC", "BIC", "aBIC", "Entropy", "T11_VLMR_PValue", "T11_LMR_PValue", "BLRT_PValue", "min_N", "max_N", "min_prob", "max_prob")</code> .
<code>sortBy</code>	Field name (as character string) by which to sort the table. Typically an information criterion (e.g., "AIC" or "BIC") is used to sort the table. Defaults to "AICC". Set to NULL by default, so the table is ordered by increasing number of classes.
<code>...</code>	Arguments passed to <a href="#">SummaryTable</a> .

**Value**

An object of class `data.frame`.

**Note**

This function is partially a wrapper around `SummaryTable`, with enhancements for summarizing mixture models.

**Author(s)**

Caspar J. van Lissa

**See Also**

[SummaryTable](#)

**Examples**

```
## Not run:
res <- createMixtures(classes = 1:2, filename_stem = "iris", rdata = iris,
                      OUTPUT = "tech11 tech14;",
                      run = 1L)
mixtureSummaryTable(res)

## End(Not run)
```

---

mplus.traceplot	<i>Plot the samples for each MCMC chain as a function of iterations</i>
-----------------	---

---

## Description

Displays a traceplot of the MCMC draws from the poster distribution of each parameter estimate for a Bayesian Mplus model. This function requires that 1) PLOT: TYPE=PLOT2; be included in the Mplus input file, 2) a gh5 file be present corresponding to the Mplus output file (and containing a bayesian\_data section), and 3) that the rhdf5 package be installed to allow the gh5 file to be imported.

## Usage

```
mplus.traceplot(mplus.model, rows = 4, cols = 4, parameters_only = TRUE)
```

## Arguments

mplus.model	An Mplus model extracted by the readModels function.
rows	Number of rows to display per plot.
cols	Optional. Number of columns to display per plot.
parameters_only	Optional. If TRUE, only the unstandardized parameter estimates from the MCMC draws will be displayed (as opposed to standardized estimates, r-square estimates, etc.). The unstandardized estimates all begin with "Parameter" in the Mplus gh5 output.

## Details

A multi-panel plot is drawn to the screen and the user is prompted to display the next plot if more than rows x columns estimates are in the model.

## Value

No value is returned by this function. Called for the side effect of displaying an MCMC chains traceplot.

## Note

Trace and density plots can also be obtained using the coda package and the bparameters element of the mplus.model object. This requires that the posterior draws be saved using SAVEDATA: BPARAMETERS syntax. See example below.

## Author(s)

Joseph Glass, Michael Hallquist

**See Also**[plot.mcmc](#)**Examples**

```
## Not run:
myModel <- readModels("BayesModel_WithGH5MCMC.out")
mplus.traceplot(myModel, rows=2, cols=3)

#alternative using the coda package
library(coda)
plot(myModel$bparameters$valid_draw)

## End(Not run)
```

MplusAutomation

*Automating Mplus Model Estimation and Interpretation***Description**

The MplusAutomation package leverages the flexibility of the R language to automate latent variable model estimation and interpretation using 'Mplus', a powerful latent variable modeling program developed by Muthen and Muthen (<http://www.statmodel.com>). Specifically, MplusAutomation provides routines for creating related groups of models, running batches of models, and extracting and tabulating model parameters and fit statistics.

**Details**

The MplusAutomation package has four primary purposes:

1. To automatically run groups/batches of models.
2. To provide routines to extract model fit statistics, parameter estimates, and raw data from 'Mplus' output files.
3. To facilitate comparisons among models
4. To provide a template language that allows for the creation of related input files.

The core routine for running batches of models is [runModels](#), with an easy-to-use GUI wrapper, [runModels\\_Interactive](#).

The core routine for extracting information from 'Mplus' outputs is [readModels](#), which returns a list containing all output sections that the package can extract.

To extract summaries, parameters, modification indices, SAVEDATA output, and all other sections that the package can understand, use the [readModels](#) function. This is the recommended way to extract 'Mplus' output with this package. If the `target` argument to [readModels](#) is a single .out file, an `mplus.model` (that is also a list) will be returned containing all output sections that the package can extract. If `target` is a directory, a list of `mplus.model` objects will be returned, named according to the output filenames.

Note: [extractModelSummaries](#) is deprecated and [readModels](#) should be preferred. To extract model summary statistics from one or more output files, see [extractModelSummaries](#), which returns a `data.frame` of fit statistics for models located within a directory. Model fit results can be summarized in tabular form (for comparing among models) using [showSummaryTable](#) (displays table in separate window), [HTMLSummaryTable](#) (creates HTML file containing summary table), or [LatexSummaryTable](#) (returns a LaTeX-formatted table of summary statistics).

Deprecated: To extract raw data created by the `SAVEDATA` command (e.g., class membership probabilities or factor scores), see [getSavedata\\_Data](#).

Deprecated: To extract unstandardized or standardized parameter estimates from a single output file, see [extractModelParameters](#).

Detailed model fit and parameter comparisons between two models can be obtained using [compareModels](#).

To create a group of related models from a single template, see [createModels](#). Please read the MplusAutomation vignette provided along with the package (and on the CRAN website) in order to understand the template language: `vignette("Vignette", package="MplusAutomation")`.

In addition to the major functions above, a function for converting an R `data.frame` for use with 'Mplus' is provided: [prepareMplusData](#). This converts the `data.frame` to a tab-delimited file and provides an 'Mplus' syntax stub for variable names.

Package:	MplusAutomation
Type:	Package

mplusAvailable	<i>Check whether Mplus can be found</i>
----------------	---

---

### Description

This is a simple utility to check whether Mplus can be found. Returns 0 if Mplus command can be found by the system. If `silent = FALSE`, prints a message to the user to help suggest what to do.

### Usage

```
mplusAvailable(silent = TRUE)
```

### Arguments

<code>silent</code>	A logical whether to print a message or not. Defaults to TRUE for silent operation.
---------------------	---

### Value

The status of finding Mplus. Per unix conventions, status 0 indicates Mplus was found (0 problems) and status 1 indicates that Mplus was not found.

### Author(s)

Joshua Wiley

### Examples

```
mplusAvailable(silent = TRUE)
mplusAvailable(silent = FALSE)
```

---

mplusGLM	<i>Function to fit GLMs in Mplus</i>
----------	--------------------------------------

---

### Description

The purpose of this function is to make it (relatively) easy to fit (most) generalized linear models in Mplus. Fitting GLMs in Mplus offers advantages such as using full information maximum likelihood for missing data, robust estimators (default used is MLR), and standard errors adjusted for clustering (planned; not currently available via `mplusGLM()`). The overarching aim of this function is to make most GLMs as easy to fit in Mplus as they are in R.

### Usage

```
mplusGLM(formula, data, idvar = "", ...)
```

**Arguments**

formula	An R formula class object as used in <code>glm()</code> . Note that currently, only basic formula are accepted. On the fly recoding, arithmetic, and on the fly interactions do not currently work.
data	A dataset.
idvar	Optional. A character string indicating the name of the ID variable. Not currently used but may be used in future.
...	Additional arguments passed to helper functions. For example <code>.mplusMultinomial()</code> .

**Details**

Note that although there are benefits to fitting GLMs in Mplus. Caution also is warranted. Using full information maximum likelihood for missing data requires a number of assumptions. These may be (badly) violated. `mplusGLM()` requires the analyst to check these as appropriate.

Currently, `mplusGLM()` only supports multinomial outcomes. More outcomes are planned in the future including binary, continuous/normal, and count outcomes.

**Value**

A list of results and Mplus model object.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
## Not run:
set.seed(1234)
tmpd <- data.frame(
  x1 = rnorm(200),
  x2 = rnorm(200),
  x3 = cut(rnorm(200),
           breaks = c(-Inf, -.7, .7, Inf),
           labels = c("a", "b", "c")))
tmpd$y <- cut(rnorm(200, sd = 2) + tmpd$x1 + tmpd$x2 + I(tmpd$x3 == "b"),
             breaks = c(-Inf, -.5, 1, Inf),
             labels = c("L", "M", "H"))
test <- mplusGLM(y ~ x1 + x2 + x3, data = tmpd)

## End(Not run)
```

---

mplusModeler

---

*Create, run, and read Mplus models.*

---

## Description

This is a convenience wrapper to automate many of the usual steps required to run an Mplus model. It relies in part on functions from the MplusAutomation package.

## Usage

```
mplusModeler(
  object,
  dataout,
  modelout,
  run = 0L,
  check = FALSE,
  varwarnings = TRUE,
  Mplus_command = detectMplus(),
  writeData = c("ifmissing", "always", "never"),
  hashfilename = TRUE,
  killOnFail = TRUE,
  quiet = TRUE,
  ...
)
```

## Arguments

object	An object of class mplusObject
dataout	the name of the file to output the data to for Mplus. If missing, defaults to modelout changing .inp to .dat.
modelout	the name of the output file for the model. This is the file all the syntax is written to, which becomes the Mplus input file. It should end in .inp. If missing, defaults to dataout changing the extension to .inp.
run	an integer indicating how many models should be run. Defaults to zero. If zero, the data and model input files are all created, but the model is not run. This can be useful for seeing how the function works and what setup is done. If one, a basic model is run. If greater than one, the model is bootstrapped with run replications as well as the basic model.
check	logical whether the body of the Mplus syntax should be checked for missing semicolons using the <a href="#">parseMplus</a> function. Defaults to FALSE.
varwarnings	A logical whether warnings about variable length should be left, the default, or removed from the output file.
Mplus_command	optional. N.B.: No need to pass this parameter for most users (has intelligent defaults). Allows the user to specify the name/path of the Mplus executable to be used for running models. This covers situations where Mplus is not in

	the system's path, or where one wants to test different versions of the Mplus program.
writeData	A character vector, one of 'ifmissing', 'always', 'never' indicating whether the data files (*.dat) should be written to disk. This is passed on to prepareMplusData. Note that previously, mplusModeler always (re)wrote the data to disk. However, now the default is to write the data to disk only if it is missing (i.e., 'ifmissing'). See details for further information.
hashfilename	A logical whether or not to add a hash of the raw data to the data file name. Defaults to TRUE in mplusModeler. Note that this behavior is a change from previous versions and differs from prepareMplusData which maintains the old behavior by default of FALSE.
killOnFail	A logical whether or not to kill any mplus processes on failure. Passed on to control behavior of runModels. Defaults to TRUE.
quiet	optional. If TRUE, show status messages in the console.
...	additional arguments passed to the prepareMplusData function.

## Details

Combined with functions from the MplusAutomation package, this function is designed to make it easy to fit Mplus models from R and to ease many of the usual frustrations with Mplus. For example, Mplus has very specific formats it accepts data in, but also very little data management facilities. Using R data management is easy. This function is designed to make using data from R in Mplus models easy. It is also common to want to fit many different models that are slight variants. This can be tedious in Mplus, but using R you can create one basic set of input, store it in a vector, and then just modify that (e.g., using regular expressions) and pass it to Mplus. You can even use loops or the `*apply` constructs to fit the same sort of model with little variants.

The `writeData` argument is new and can be used to reduce overhead from repeatedly writing the same data from R to the disk. When using the 'always' option, `mplusModeler` behaves as before, always writing data from R to the disk. This remains the default for the `prepareMplusData` function to avoid confusion or breaking old code. However, for `mplusModeler`, the default has been set to 'ifmissing'. In this case, R generates an md5 hash of the data prior to writing it out to the disk. The md5 hash is based on: (1) the dimensions of the dataset, (2) the variable names, (3) the class of every variable, and (4) the raw data from the first and last rows. This combination ensures that under most all circumstances, if the data changes, the hash will change. The hash is appended to the specified data file name (which is controlled by the logical `hashfilename` argument). Next R checks in the directory where the data would normally be written. If a data file exists in that directory that matches the hash generated from the data, R will use that existing data file instead of writing out the data again. A final option is 'never'. If this option is used, R will not write the data out even if no file matching the hash is found.

## Value

An Mplus model object, with results. If `run = 1`, returns an invisible list of results from the run of the Mplus model (see `readModels` from the MplusAutomation package). If `run = 0`, the function returns a list with two elements, 'model' and 'boot' that are both NULL. if `run >= 1`, returns a list with two elements, 'model' and 'boot' containing the regular Mplus model output and the boot object, respectively. In all cases, the Mplus data file and input files are created.

---

mplusObject

---

*Create an Mplus model object*

---

## Description

This is a function to create an Mplus model object in R. The object holds all the sections of an Mplus input file, plus some extra R ones. Once created, the model can be run using other functions such as `mplusModeler` or updated using methods defined for the update function.

## Usage

```

mplusObject(
  TITLE = NULL,
  DATA = NULL,
  VARIABLE = NULL,
  DEFINE = NULL,
  MONTECARLO = NULL,
  MODELPOPULATION = NULL,
  MODELMISSING = NULL,
  ANALYSIS = NULL,
  MODEL = NULL,
  MODELINDIRECT = NULL,
  MODELCONSTRAINT = NULL,
  MODELTEST = NULL,
  MODELPRIORS = NULL,
  OUTPUT = NULL,
  SAVEDATA = NULL,
  PLOT = NULL,
  usevariables = NULL,
  rdata = NULL,
  autov = TRUE,
  imputed = FALSE,

```

```

    quiet = TRUE,
    ...
)

```

## Arguments

TITLE	A character string of the title for Mplus.
DATA	A character string of the data section for Mplus (note, do not define the filename as this is generated automatically)
VARIABLE	A character string of the variable section for Mplus (note, do not define the variable names from the dataset as this is generated automatically)
DEFINE	A character string of the define section for Mplus (optional)
MONTECARLO	A character string of the montecarlo section for Mplus (optional). If used, autov defaults to FALSE instead of the usual default, TRUE, but may still be overwritten, if desired.
MODELPOPULATION	A character string of the MODEL POPULATION section for Mplus (optional).
MODELMISSING	A character string of the MODEL MISSING section for Mplus (optional).
ANALYSIS	A character string of the analysis section for Mplus (optional)
MODEL	A character string of the model section for Mplus (optional, although typically you want to define a model)
MODELINDIRECT	A character string of the MODEL INDIRECT section for Mplus (optional).
MODELCONSTRAINT	A character string of the MODEL CONSTRAINT section for Mplus (optional).
MODELTEST	A character string of the MODEL TEST section for Mplus (optional).
MODELPRIORS	A character string of the MODEL PRIORS section for Mplus (optional).
OUTPUT	A character string of the output section for Mplus (optional)
SAVEDATA	A character string of the savedata section for Mplus (optional)
PLOT	A character string of the plot section for Mplus (optional)
usevariables	A character vector of the variables from the R dataset to use in the model.
rdata	An R dataset to be used for the model.
autov	A logical (defaults to TRUE) argument indicating whether R should attempt to guess the correct variables to use from the R dataset, if usevariables is left NULL.
imputed	A logical whether the data are multiply imputed (a list). Defaults to FALSE.
quiet	optional. If TRUE, show status messages in the console.
...	Arguments passed on to <code>mplusModeler</code> if <code>run &gt; 0</code> .

## Details

Mplus model objects allow a base model to be defined, and then flexibly update the data, change the precise model, etc. If a section does not vary between models, you can leave it the same. For example, suppose you are fitting a number of models, but in all cases, wish to use maximum likelihood estimator, “ANALYSIS: ESTIMATOR = ML;” and would like standardized output, “OUTPUT: STDYX;”. Rather than retype those in every model, they can be defined in one Mplus model object, and then that can simply be updated with different models, leaving the analysis and output sections untouched. This also means that if a reviewer comes back and asks for all analyses to be re-run say using the robust maximum likelihood estimator, all you have to do is change it in the model object once, and re run all your code.

## Value

A list of class `mplusObject` with elements

TITLE	The title in Mplus (if defined)
DATA	The data section in Mplus (if defined)
VARIABLE	The variable section in Mplus (if defined)
DEFINE	The define section in Mplus (if defined)
MONTECARLO	The montecarlo section in Mplus (if defined)
MODELPOPULATION	The modelpopulation section in Mplus (if defined)
MODELMISSING	The modelmissing section in Mplus (if defined)
ANALYSIS	The analysis section in Mplus (if defined)
MODEL	The model section in Mplus (if defined)
MODELINDIRECT	The modelindirect section in Mplus (if defined)
MODELCONSTRAINT	The modelconstraint section in Mplus (if defined)
MODELTEST	The modeltest section in Mplus (if defined)
MODELPRIORS	The modelpriors section in Mplus (if defined)
OUTPUT	The output section in Mplus (if defined)
SAVEDATA	The savedata section in Mplus (if defined)
PLOT	The plot section in Mplus (if defined)
results	NULL by default, but can be later updated to include the results from the model run.
usevariables	A character vector of the variables from the R data set to be used.
rdata	The R data set to use for the model.
imputed	A logical whether the data are multiply imputed.
autov	A logical whether the data should have the usevariables detected automatically or not

```

---

mplusRcov

---

*Create Mplus code for various residual covariance structures.*

---

**Description**

This function makes it easy to write the Mplus syntax for various residual covariance structure.

**Usage**

```

mplusRcov(
  x,
  type = c("homogenous", "heterogenous", "cs", "toeplitz", "ar", "un"),
  r = "rho",
  e = "e",
  collapse = FALSE
)

```

### Arguments

x	input character vector of variable names, ordered by time
type	A character string indicating the type of residual covariance structure to be used. Defaults to 'homogenous'. Current options include 'homogenous', 'heterogenous', 'cs' for compound symmetric, 'toeplitz' for banded toeplitz, 'ar' for autoregressive, and 'un' for unstructured.
r	a character vector of the base label to name covariance parameters. Defaults to 'rho'.
e	a character vector of the error variance of the variable. Used to create constraints on the covariance parameters. Defaults to 'e'.
collapse	whether to collapse the covariance code using 'PWITH'. Note that at the time of writing, Mplus does not allow more than 80 characters per row. Defaults to FALSE.

### Details

The **homogenous** residual covariance structure estimates one parameter: the residual variance,  $\sigma_e^2$ . The residual variance is assumed to be identical for all variables and all covariances are assumed to be zero. The structure is represented in this table.

	t1	t2	t3	...	tn
t1	$\sigma_e^2$			...	
t2	0	$\sigma_e^2$		...	
t3	0	0	$\sigma_e^2$	...	
...	...	...	...	...	...
tn	0	0	0	...	$\sigma_e^2$

The **heterogenous** residual covariance structure estimates **n** parameters, where **n** is the number of variables. A unique residual variance is estimated for every variable. All covariances are assumed to be zero. The structure is represented in this table.

	t1	t2	t3	...	tn
t1	$\sigma_{e1}^2$			...	
t2	0	$\sigma_{e2}^2$		...	
t3	0	0	$\sigma_{e3}^2$	...	
...	...	...	...	...	...
tn	0	0	0	...	$\sigma_{en}^2$

The **compound symmetric** residual covariance structure estimates two parameters: one for the residual variance,  $\sigma_e^2$ , and one for the covariance. The residual variance is assumed to be identical for all variables and all covariances are assumed to be identical. The structure is represented in this table.

t1	t2	t3	...	tn
----	----	----	-----	----

t1	$\sigma_e^2$			...
t2	$\rho$	$\sigma_e^2$		...
t3	$\rho$	$\rho$	$\sigma_e^2$	...
...	...	...	...	...
tn	$\rho$	$\rho$	$\rho$	...

The **toeplitz** residual covariance structure estimates **n** parameters, one for every band of the matrix. The residual variance,  $\sigma_e^2$ , is assumed to be identical for all variables. The covariances one step removed are all assumed identical. Likewise for all further bands. The structure is represented in this table.

	t1	t2	t3	...	tn
t1	$\sigma_e^2$			...	
t2	$\rho$	$\sigma_e^2$		...	
t3	$\rho_2$	$\rho$	$\sigma_e^2$	...	
...	...	...	...	...	...
tn	$\rho_n$	$\rho_{n-1}$	$\rho_{n-2}$	...	$\sigma_e^2$

The **autoregressive** residual covariance structure has two parameters: the residual variance,  $\sigma_e^2$  and the correlation between adjacent time points,  $\rho$ . The variances are constrained to be equal for all time points. A single correlation parameter is estimated. The  $\rho$  is the correlation between adjacent time points such as 1 and 2 or 2 and 3. More distant relationships are assumed to have smaller correlations, decreasing exponentially. Thus between 1 and 3, the estimate is  $\rho^2$ . The structure is represented in this table.

	t1	t2	t3	...	tn
t1	$\sigma_e^2$			...	
t2	$\rho$	$\sigma_e^2$		...	
t3	$\rho^2$	$\rho$	$\sigma_e^2$	...	
...	...	...	...	...	...
tn	$\rho^{n-1}$	$\rho^{n-2}$	$\rho^{n-3}$	...	$\sigma_e^2$

Because structural equation models generally model covariance structures, the autoregressive residual structure must be parameterized in terms of covariances. This is done in two parts. First, the function returns syntax to estimate all the pairwise covariances, labelling the parameters  $\rho$ ,  $\rho^2$ , etc. so that they are constrained to be equal. Next, it returns the syntax for the necessary model constraints to constrain the different covariances, to decrease exponentially in their correlations. This is done via:

$$\rho^2 = \left(\frac{\rho}{\sigma_e^2}\right)^2 \sigma_e^2$$

and likewise for all later time points.

The **unstructured** residual covariance structure estimates  $\frac{n(n+1)}{2}$  parameters. It is unstructured in that every variance and covariance is freely estimated with no constraints. However, in most cases, this results in an overparameterized model and is unestimable. The structure is represented in this table.

	t1	t2	t3	...	tn
t1	$\sigma_{e1}^2$			...	
t2	$\rho_1$	$\sigma_{e2}^2$		...	
t3	$\rho_2$	$\rho_3$	$\sigma_{e3}^2$	...	
...	...	...	...	...	...
tn	$\rho_5$	$\rho_6$	$\rho_7$	...	$\sigma_{en}^2$

**Value**

A named character vector of class ‘MplusRstructure’ with four elements:

all	A character string collapsing all other sections.
Variances	A character string containing all of the variances.
Covariances	A character string containing all of the covariances, properly labelled to allow constraints and the autoregressive residual covariance structure.
Constraints	A character string containing the ‘MODEL CONSTRAINT’ section and code needed to parameterize the residual covariance structure as autoregressive.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
# all five structures collapsing
mplusRcov(letters[1:4], "homogenous", "rho", "e", TRUE)
mplusRcov(letters[1:4], "heterogenous", "rho", "e", TRUE)
mplusRcov(letters[1:4], "cs", "rho", "e", TRUE)
mplusRcov(letters[1:4], "toeplitz", "rho", "e", TRUE)
mplusRcov(letters[1:4], "ar", "rho", "e", TRUE)
mplusRcov(letters[1:4], "un", "rho", "e", TRUE)

# all five structures without collapsing
# useful for long names or many variables
# where a line may cross 80 characters
mplusRcov(letters[1:4], "homogenous", "rho", "e", FALSE)
mplusRcov(letters[1:4], "heterogenous", "rho", "e", FALSE)
mplusRcov(letters[1:4], "cs", "rho", "e", FALSE)
mplusRcov(letters[1:4], "toeplitz", "rho", "e", FALSE)
mplusRcov(letters[1:4], "ar", "rho", "e", FALSE)
mplusRcov(letters[1:4], "un", "rho", "e", FALSE)
```

paramExtract

*Extract parameters from a data frame of Mplus estimates***Description**

This is a simple convenience function designed to facilitate looking at specific parameter types by easily return a subset of a data frame with those types only. It is designed to follow up the results returned from the [readModels](#) function.

**Usage**

```
paramExtract(
  x,
  params = c("regression", "loading", "undirected", "expectation", "variability", "new")
)
```

**Arguments**

- |        |   |
|--------|---|
| x      | A data frame (specifically the type returned by readModels) containing parameters. Should be specific such as unstandardized and the data frame must have a column called 'paramHeader'.  |
| params | A character string indicating the types of parameters to be returned. Options currently include 'regression', 'loading', 'undirected', 'expectation', 'variability', and 'new' for new/additional parameters. Regressions include regression of one variable ON another. 'loading' include indicator variables (which are assumed caused by the underlying latent variable) and variables in latent growth models (BY or  ). Undirected paths currently only include covariances, indicated by the WITH syntax in Mplus. Expectation paths are the unconditional or conditional expectations of variables. In other words those parameters related to the first moments. For independent variables, these are the means, $E(X)$ and the conditional means or intercepts, $E(X f(\theta))$ where $f(\theta)$ is the model, some function of the parameters, $\theta$ . Finally 'variability' refers to both variances and residual variances, corresponding to the second moments. As with the expectations, variances are unconditional for variables that are not predicted or conditioned on any other variable in the model whereas residual variances are conditional on the model. Note that R uses fuzzy matching so that each of these can be called via shorthand, 'r', 'l', 'u', 'e', and 'v'. |

**Value**

A subset data frame with the parameters of interest.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**See Also**[readModels](#)**Examples**

```
## Not run:
test <- mplusObject(
  TITLE = "test the MplusAutomation Package and my Wrapper;",

"
```

---

parseMplus

*Check Mplus code for missing semicolons or too long lines.*

---

## Description

The function parses a character string containing Mplus code and checks that every non blank line ends in either a colon or a semicolon. In addition, it checks that every line is less than 90 characters, because Mplus ignores everything after 90 characters on a line which can be a source of enigmatic errors.

## Usage

```
parseMplus(x, add = FALSE)
```

## Arguments

x	a character string containing Mplus code.
add	logical indicating whether or not to add semicolons to lines that do not have them. Defaults to FALSE.

## Details

The function is fairly basic at the moment. It works by simply removing blank space (spaces, tabs, etc.) and then if a line does not terminate in a colon or semicolon, it returns a note and the line number. Optionally, it can add semicolons to any lines missing them and return the input with added semicolons. To check for lines that are too long, all trailing (but not before) white space is removed, and then the number of characters is checked.

**Value**

a character vector containing the input text and optionally added semicolons.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

```
# sample input
test <- "
MODEL:
  mpg ON wt hp;
  wt WITH hp
"

# check and return
cat(parseMplus(test), file=stdout(), fill=TRUE)
# add missing semicolons and return
cat(parseMplus(test, TRUE), file=stdout(), fill=TRUE)
# line that is too long for Mplus
test <- "
MODEL:
  mpg cyl disp hp drat wt qsec vs am gear PWITH cyl disp hp drat wt qsec vs am gear carb;
"

cat(parseMplus(test), file=stdout())
```

---

plot.mplusObject	<i>Plot coefficients for an mplusObject</i>
------------------	---

---

**Description**

This is a method for plotting the coefficients of an mplusObject.

**Usage**

```
## S3 method for class 'mplusObject'
plot(x, y, type = c("stdyx", "un", "std", "stdy"), ...)
```

**Arguments**

x	An object of class mplusObject
y	Not currently used
type	A character vector indicating the type of coefficients to return. One of “un”, “std”, “stdy”, or “stdyx”. Defaults to “stdyx”.
...	Additional arguments to pass on (not currently used)

**Value**

Nothing. Called for its side effect of plotting the coefficients.

**Author(s)**

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
## Not run:
# simple example of a model using builtin data
# demonstrates use

## End(Not run)
```

---

plotMixtureDensities    *Create density plots for mixture models*

---

**Description**

Creates a density plot for a single object of class 'mplus.model', or a faceted plot of density plots for an object of class 'mplus.model.list'. For each variable, a Total density plot will be shown, along with separate density plots for each latent class, where cases are weighted by the posterior probability of being assigned to that class.

**Usage**

```
plotMixtureDensities(
  modelList,
  variables = NULL,
```

```

    bw = FALSE,
    conditional = FALSE,
    alpha = 0.2,
    facet_labels = NULL
  )

```

### Arguments

<code>modellist</code>	A list object of Mplus models, or a single Mplus model
<code>variables</code>	Which variables to plot. If NULL, plots all variables that are present in all Mplus models.
<code>bw</code>	Logical. Whether to make a black and white plot (for print) or a color plot. Defaults to FALSE, because these density plots are hard to read in black and white.
<code>conditional</code>	Logical. Whether to show a conditional density plot (surface area is divided amongst the latent classes), or a classic density plot (surface area of the total density plot is equal to one, and is subdivided amongst the classes).
<code>alpha</code>	Numeric (0-1). Only used when <code>bw</code> and <code>conditional</code> are FALSE. Sets the transparency of <code>geom_density</code> , so that classes with a small number of cases remain visible.
<code>facet_labels</code>	Named character vector, the names of which should correspond to the facet labels one wishes to rename, and the values of which provide new names for these facets. For example, to rename variables, in the example with the 'iris' data below, one could specify: <code>facet_labels = c("Pet_leng" = "Petal length")</code> .

### Value

An object of class 'ggplot'.

### Note

This function returns warnings, indicating that `sum(weights) != 1`. These can be ignored. The sum of the "Total" density per variable per model is equal to 1, and the sum of all of the posterior probabilities is equal to 1. This results in a normal density plot for the "Total", which is subdivided by the latent classes, in proportion to the posterior probabilities of participants being assigned to those classes.

### Author(s)

Caspar J. van Lissa

### Examples

```

## Not run:
results <- createMixtures(classes = 1:3, filename_stem = "iris",
                          rdata = iris, run = 1L)
plotMixtureDensities(results)

## End(Not run)

```

```
## Not run:
plotMixtureDensities(results, variables = "PETAL_LE")

## End(Not run)
## Not run:
plotMixtureDensities(results, bw = TRUE)

## End(Not run)
## Not run:
plotMixtureDensities(results, bw = FALSE, conditional = TRUE)

## End(Not run)
## Not run:
plotMixtureDensities(results[[2]], variables = "PETAL_LE")

## End(Not run)
```

---

plotMixtures

---

*Create latent profile plots*

---

## Description

Creates a profile plot for a single object of class 'mplus.model', or a faceted plot of profile plots for an object of class 'mplus.model.list'.

## Usage

```
plotMixtures(
  modelList,
  variables = NULL,
  coefficients = c("unstandardized", "stdyx.standardized", "stdy.standardized",
    "stdy.standardized"),
  parameter = c("Means", "Intercepts"),
  ci = 0.95,
  bw = FALSE,
  rawdata = FALSE,
  alpha_range = c(0, 0.1)
)
```

## Arguments

modelList	A list of Mplus mixture models, or a single mixture model
variables	A character vectors with the names of the variables (included in the Mplus output) to be plotted.
coefficients	Which type of coefficients to plot on the y-axis; default is 'unstandardized'. Options include: c('stdyx.standardized', 'stdy.standardized', 'std.standardized')
parameter	Which parameter to plot (from Mplus parameter estimate headings included in the output). Defaults to c('Means', 'Intercepts').

ci	What confidence interval should the errorbars span? Defaults to a 95% confidence interval. Set to NULL to remove errorbars.
bw	Logical. Should the plot be black and white (for print), or color?
rawdata	Should raw data be plotted in the background? Setting this to TRUE might result in long plotting times. Requires including the Mplus syntax 'SAVEDATA: FILE IS "filename"; SAVE = cprobabilities' in the Mplus input.
alpha_range	The minimum and maximum values of alpha (transparency) for the raw data. Minimum should be 0; lower maximum values of alpha can help reduce overplotting.

**Value**

An object of class 'ggplot'.

**Author(s)**

Caspar J. van Lissa

**Examples**

```
## Not run:
res <- createMixtures(classes = 1:2, filename_stem = "cars",
                      model_overall = "wt ON drat;",
                      model_class_specific = "wt; qsec;",

## End(Not run)
```

---

```
prepareMplusData
```

---

```
Create tab-delimited file and Mplus input syntax from R data.frame
```

---

**Description**

The prepareMplusData function converts an R data.frame (or a list of data frames), into a tab-delimited file (without header) to be used in an Mplus input file. The corresponding Mplus syntax, including the data file definition and variable names, is printed to the console or optionally to an input file.

**Usage**

```
prepareMplusData(
  df,
  filename = NULL,
  inpfile = FALSE,
  keepCols = NULL,
  dropCols = NULL,
  dummyCode = NULL,
  interactive = TRUE,
  overwrite = TRUE,
  imputed = FALSE,
  writeData = c("always", "ifmissing", "never"),
  hashfilename = FALSE,
  quiet = TRUE
)
```

**Arguments**

df	The R data.frame to be prepared for Mplus
filename	The path and filename for the tab-delimited data file for use with Mplus. Example: "C:/Mplusdata/data1.dat"
inpfile	Logical value whether the Mplus syntax should be written to the console or to an input file. Defaults to FALSE. If TRUE, the file name will be the same as filename with the extension changed to .inp. Alternately, this can be a character string giving the file name to write the Mplus syntax to.
keepCols	A character vector specifying the variable names within df to be output to filename or a numeric vector of the column indices to be output or a logical vector corresponding to the same.
dropCols	A character vector specifying the variable names within df to be omitted from the data output to filename or a numeric vector of the column indices not to be output or a logical vector corresponding to the same.
dummyCode	An optional character vector of column names indicating categorical variables in the dataset that should be converted into dummy codes (using the fastDummies package). Note that one dummy code is returned for *each level*, so no reference category is implied. Thus, it is up to you to drop one of the dummy codes in the Mplus syntax to denote the reference category and avoid multicollinearity.
interactive	Logical value indicating whether file names should be selected interactively. If filename is missing and interactive=TRUE, then a dialogue box will pop up to select a file or a console prompt if in a non interactive context. Defaults to TRUE.
overwrite	Logical value indicating whether data and input (if present) files should be overwritten. Defaults to TRUE to be consistent with prior behavior. If FALSE and the file to write the data to already exists, it will throw an error.
imputed	A logical whether data are multiply imputed. Defaults to FALSE. If TRUE, the data should be a list, where each element of the list is a multiply imputed dataset.

<code>writeData</code>	A character vector, one of ‘always’, ‘ifmissing’, ‘never’ indicating whether the data files (*.dat) should be written to disk. Defaults to ‘always’ for consistency with previous behavior. See details for further information.
<code>hashfilename</code>	A logical whether or not to add a hash of the raw data to the data file name. Defaults to FALSE for consistency with previous behavior where this feature was not available.
<code>quiet</code>	optional. If TRUE, show status messages in the console.

### Details

The `writeData` argument is new and can be used to reduce overhead from repeatedly writing the same data from R to the disk. When using the ‘always’ option, `prepareMplusData` behaves as before, always writing data from R to the disk. When ‘ifmissing’, R generates an md5 hash of the data prior to writing it out to the disk. The md5 hash is based on: (1) the dimensions of the dataset, (2) the variable names, (3) the class of every variable, and (4) the raw data from the first and last rows. This combination ensures that under most all circumstances, if the data changes, the hash will change. The hash is appended to the specified data file name (which is controlled by the logical `hashfilename` argument). Next R checks in the directory where the data would normally be written. If a data file exists in that directory that matches the hash generated from the data, R will use that existing data file instead of writing out the data again. A final option is ‘never’. If this option is used, R will not write the data out even if no file matching the hash is found.

### Value

Invisibly returns a character vector of the Mplus input syntax. Primarily called for its side effect of creating Mplus data files and optionally input files.

## End(Not run)
```

---

```
print.MplusRstructure Print an Mplus Residual Structure object
```

---

## Description

This is a method for printing an Mplus Residual Structure object.

## Usage

```
## S3 method for class 'MplusRstructure'  
print(x, ...)
```

## Arguments

x	An object of class MplusRstructure
...	Additional arguments to pass on (not currently used)

## Value

NULL Called for its side effect of printing the object to the console

## Author(s)

Joshua F. Wiley <jwiley.psych@gmail.com>

## See Also

Other Mplus-Formatting: [coef.mplus.model\(\)](#), [confint.mplus.model\(\)](#), [extract\(\)](#), [summary.mplusObject\(\)](#)

## Examples

```
# default 'show' uses printing  
mplusRcov(c("a", "b", "c"), type = "ar")  
  
# also if calling print explicitly  
print(mplusRcov(c("a", "b", "c"), type = "ar"))  
  
# to see all aspects of the raw/original object  
str(mplusRcov(c("a", "b", "c"), type = "ar"))
```

---

readModels	<i>Read Parameters, Summary Statistics, and Savedata from Mplus Output</i>
------------	--

---

## Description

Extracts information from one or more Mplus output files, including fit statistics and parameters. Its is to parse all (supported) aspects of Mplus output and to combine these into a list object, with one element per output file identified.

## Usage

```
readModels(
  target = getwd(),
  recursive = FALSE,
  filefilter,
  what = "all",
  quiet = TRUE
)
```

## Arguments

target	the directory containing Mplus output files (.out) to parse OR the single output file to be parsed. May be a full path, relative path, or a filename within the working directory. Defaults to the current working directory. Example: "C:/Users/Michael/Mplus Runs"
recursive	optional. If TRUE, parse all models nested in subdirectories within target. Defaults to FALSE.
filefilter	a Perl regular expression (PCRE-compatible) specifying particular output files to be parsed within directory. See regex or <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for details about regular expression syntax.
what	a character vector denoting what aspects of Mplus output to extract. Defaults to "all", which will extract all supported output sections. See details for additional information.
quiet	whether to suppress printing to the screen the file currently being processed. Defaults to TRUE.

## Details

The what parameter defaults to "all", which extracts all supported output. If you would like to extract a reduced set of output sections (especially to speed up the function when reading many files), specify the sections as a character vector from the following options:

```
c("input", "warn_err", "data_summary", "sampstat", "covariance_coverage", "summaries", "parameters", "class_counts", "indirect", "mod_indices", "residuals", "savedata", "bparameters", "tech1", "tech3", "tech4", "tech7", "tech8", "tech9", "tech10", "tech12", "fac_score_stats", "lcCondMeans", "gh5", "output")
```

**Value**

A list with one `mplus.model` per file. Each `mplus.model` object is composed of elements containing major output sections, as detailed below. If `target` is a single file, then the top-level elements will be a single `mplus.model` object, not a list of files. Specific elements are:

<code>input</code>	Mplus input syntax parsed into a list by major section
<code>warnings</code>	Syntax and estimation warnings as a list
<code>errors</code>	Syntax and estimation errors as a list
<code>data_summary</code>	Output of SUMMARY OF DATA section, including cluster sizes and ICCs
<code>sampstat</code>	Sample statistics provided by OUTPUT: SAMPSTAT, if specified
<code>covariance_coverage</code>	Covariance coverage matrix for checking missingness patterns
<code>summaries</code>	Summary statistics from <code>extractModelSummaries</code> , having structure as specified by that function
<code>parameters</code>	Model parameters from <code>extractModelParameters</code> , having structure as specified by that function
<code>class_counts</code>	Latent class counts and proportions for models that include a categorical latent variable
<code>indirect</code>	Output of MODEL INDIRECT if available in output. Contains <code>\$overall</code> and <code>\$specific</code> data.frames for each indirect effect section
<code>mod_indices</code>	Model modification indices from <code>extractModIndices</code> , having structure as specified by that function
<code>residuals</code>	a list containing relevant information from OUTPUT: RESIDUALS
<code>savedata_info</code>	File information about SAVEDATA files related to this output
<code>savedata</code>	SAVEDATA file as an R data.frame, as described in <code>getSavedata_Data</code>
<code>bparameters</code>	an <code>mcmc.list</code> object containing the draws from the MCMC chains for a Bayesian model that uses the SAVEDATA: BPARAMETERS command
<code>tech1</code>	a list containing parameter specification and starting values from OUTPUT: TECH1
<code>tech3</code>	a list containing parameter covariance and correlation matrices from OUTPUT: TECH3
<code>tech4</code>	a list containing means, covariances, and correlations for latent variables from OUTPUT: TECH4
<code>tech7</code>	a list containing sample statistics for each latent class from OUTPUT: TECH7
<code>tech8</code>	a list containing optimization history of the model. Currently only supports potential scale reduction in BAYES. OUTPUT: TECH8
<code>tech9</code>	a list containing warnings/errors from replication runs for MONTECARLO analyses from OUTPUT: TECH9
<code>tech10</code>	a list containing model fit information from OUTPUT: TECH10
<code>,</code>	

tech12	a list containing observed versus estimated sample statistics for TYPE=MIXTURE analyses from OUTPUT: TECH12
fac_score_stats	factor score mean, correlation, and covariance structure from SAMPLE STATISTICS FOR ESTIMATED FACTOR SCORES section
lcCondMeans	conditional latent class means and pairwise comparisons, obtained using auxiliary(e) syntax in latent class models
gh5	a list containing data from the gh5 (graphics) file corresponding to this output. (Requires rhdf5 package)
output	The entire, raw output file.

**Author(s)**

Michael Hallquist

**Examples**

```
## Not run:
allOutput <- readModels(
  "C:/Program Files/Mplus/Mplus Examples/User's Guide Examples", recursive=TRUE)

## End(Not run)
```

---

runModels

*Run Mplus Models*

---

**Description**

This function runs a group of Mplus models (.inp files) located within a single directory or nested within subdirectories.

**Usage**

```
runModels(
  target = getwd(),
  recursive = FALSE,
  filefilter = NULL,
  showOutput = FALSE,
  replaceOutfile = "always",
  logFile = "Mplus Run Models.log",
  Mplus_command = detectMplus(),
  killOnFail = TRUE,
  local_tmpdir = FALSE,
  quiet = TRUE
)
```

**Arguments**

target	a character vector where each element is a directory containing Mplus input files (.inp) to run OR a single .inp file to be run. Elements may be a full path, relative path, or a filename within the working directory. Defaults to the current working directory. Example: “C:/Users/Michael/Mplus Runs”
recursive	optional. If TRUE, run all models nested in subdirectories within directory. Defaults to FALSE. Not relevant if target is a single file.
filefilter	a Perl regular expression (PCRE-compatible) specifying particular input files to be run among those found in target. See regex or <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for details about regular expression syntax.
showOutput	optional. If TRUE, show estimation output (TECH8) in the R console. Note that if run within Rgui, output will display within R, but if run via Rterm, a separate window will appear during estimation.
replaceOutfile	optional. Currently supports three settings: “always”, which runs all models, regardless of whether an output file for the model exists; “never”, which does not run any model that has an existing output file; and “modifiedDate”, which only runs a model if the modified date for the input file is more recent than the output file modified date (implying there have been updates to the model).
logFile	optional. If non-null, specifies a file (and optionally, directory) that records the settings passed into the function and the models run (or skipped) during the run.
Mplus_command	optional. N.B.: No need to pass this parameter for most users (has intelligent defaults). Allows the user to specify the name/path of the Mplus executable to be used for running models. This covers situations where Mplus is not in the system’s path, or where one wants to test different versions of the Mplus program.
killOnFail	optional. Windows only for now. If TRUE, kill all processes named mplus.exe when runModels does not terminate normally. Defaults to TRUE.
local_tmpdir	optional. Linux/Mac for now. If TRUE, set the TMPDIR environment variable to the location of the .inp file prior to execution. This is useful in Monte Carlo studies where many instances of Mplus may run in parallel and we wish to avoid collisions in temporary files among processes.
quiet	optional. If FALSE, show status messages in the console.

**Value**

None. Function is used for its side effects (running models).

**Author(s)**

Michael Hallquist

```

---

runModels\_Interactive    *Run Mplus Models Using Graphical Interface*

---

## Description

This function provides a graphical user interface to the runModels function. It uses Tcl/Tk to display a window in which the user can specify parameters for runModels, including the directory for runs, recursing through subdirectories, displaying output on the console, and replacing existing outfiles.

## Usage

```
runModels_Interactive(
  directory = getwd(),
  recursive = "0",
  showOutput = "1",
  replaceOutfile = "1",
  checkDate = "0",
  logFile = "1"
)
```

## Arguments

directory	optional. The starting directory that will display in the dialog window. Defaults to the current working directory.
recursive	optional. Whether the recursive checkbox should be checked when the window opens. "0" for FALSE, "1" for TRUE.
showOutput	optional. Whether the show output checkbox should be checked when the window opens. "0" for FALSE, "1" for TRUE.
replaceOutfile	optional. Whether the replace outfile checkbox should be checked when the window opens. "0" for FALSE, "1" for TRUE.
checkDate	optional. Whether the check modified date checkbox should be checked when the window opens. "0" for FALSE, "1" for TRUE.
logFile	optional. Whether the log file checkbox should be checked when the window opens. "0" for FALSE, "1" for TRUE.

**Details**

This function exists as a GUI wrapper for `runModels` and does not provide any distinct functionality.

**Value**

None. Function is used to display user interface for running models.

```

---

`separateHyphens`*Separate Hyphenated Variable Strings*

---

**Description**

This code is a simplified form of `expandCmd` from the **lavaan** package. It separates hyphenated variable strings into a list of vectors, while ignoring hyphens that may be used in numbers.

**Usage**

```
separateHyphens(cmd)
```

**Arguments**

<code>cmd</code>	A character string
------------------	--------------------

**Details**

Note that this is an internal function only.

**Value**

The character string if no hyphens, or a list of vectors if there are hyphens.

**Author(s)**

Michael Hallquist revised by Joshua Wiley

## Examples

```
MplusAutomation:::separateHyphens("x1x4")
MplusAutomation:::separateHyphens("x1-x4")
MplusAutomation:::separateHyphens("x1-x4; x1*-1; v1-v3;")
```

---

showSummaryTable	<i>Display summary table of Mplus model statistics in separate window</i>
------------------	---

---

## Description

Displays a summary table of model fit statistics extracted using the `extractModelSummaries` function. This function relies on the `showData` function from the `relimp` package, which displays data in a Tk-based window. By default, the following summary statistics are included: Title, LL, Parameters, AIC, AICC, BIC, RMSEA\_Estimate, but these are customizable using the `keepCols` and `dropCols` parameters.

## Usage

```
showSummaryTable(
  modelList,
  keepCols,
  dropCols,
  sortBy = NULL,
  font = "Courier 9"
)
```

## Arguments

<code>modelList</code>	A list of models (as a <code>data.frame</code> ) returned from the <code>extractModelSummaries</code> function.
<code>keepCols</code>	A vector of character strings indicating which columns/variables to display in the summary. Only columns included in this list will be displayed (all others excluded). By default, <code>keepCols</code> is: <code>c("Title", "LL", "Parameters", "AIC", "AICC", "BIC", "RMSEA_Estimate")</code> . Example: <code>c("Title", "LL", "AIC", "CFI")</code>
<code>dropCols</code>	A vector of character strings indicating which columns/variables to omit from the summary. Any column not included in this list will be displayed. By default, <code>dropCols</code> is <code>NULL</code> . Example: <code>c("InputInstructions", "TLI")</code>
<code>sortBy</code>	Optional. Field name (as character string) by which to sort the table. Typically an information criterion (e.g., "AIC" or "BIC") is used to sort the table. Defaults to <code>NULL</code> , which does not sort the table.
<code>font</code>	Optional. The font to be used to display the summary table. Defaults to Courier 9.

**Value**

No value is returned by this function. It is solely used to display the summary table in a separate window.

**Note**

You must choose between keepCols and dropCols because it is not sensible to use these together to include and exclude columns. The function will error if you include both parameters.

```

---

SummaryTable

---

*Create a summary table of Mplus model statistics*

---

**Description**

Creates output (optionally sent to a file) containing a summary table of model fit statistics extracted using the `extractModelSummaries` function. By default, the following summary statistics are included: Title, LL, Parameters, AIC, AICC, BIC, RMSEA\_Estimate, but these are customizable using the `keepCols` and `dropCols` parameters.

**Usage**

```
SummaryTable(
  modellist,
  type = c("none", "screen", "popup", "html", "latex", "markdown"),
  filename = "",
  keepCols,
```

```

    dropCols,
    sortBy = NULL,
    caption = "",
    display = FALSE,
    ...,
    include.rownames = FALSE
)

```

## Arguments

<code>modelList</code>	A list of models returned from the <code>extractModelSummaries</code> function.
<code>type</code>	A character vector indicating the type of output format to be generated. One of: “none”, “screen”, “popup”, “html”, “latex”, or “markdown”. Screen results in a simple summary table being sent to the R console.
<code>filename</code>	The name of the file to be created. Can be an absolute or relative path. If filename is a relative path or just the filename, then it is assumed that the file resides in the working directory <code>getwd()</code> . Example: “Mplus Summary.html”. By default, no filename is given, which results in the output being sent to the console. Note that currently, filename only has an effect for “html” and “latex”.
<code>keepCols</code>	A vector of character strings indicating which columns/variables to display in the summary. Only columns included in this list will be displayed (all others excluded). By default, <code>keepCols</code> is: <code>c("Title", "LL", "Parameters", "AIC", "AICC", "BIC", "RMSEA_Estimate")</code> . Example: <code>c("Title", "LL", "AIC", "CFI")</code>
<code>dropCols</code>	A vector of character strings indicating which columns/variables to omit from the summary. Any column not included in this list will be displayed. By default, <code>dropCols</code> is <code>NULL</code> . Example: <code>c("InputInstructions", "TLI")</code>
<code>sortBy</code>	optional. Field name (as character string) by which to sort the table. Typically an information criterion (e.g., “AIC” or “BIC”) is used to sort the table. Defaults to <code>NULL</code> , which does not sort the table.
<code>caption</code>	A character string, the caption to be given to the table. Currently only applies to types “html”, “latex”, and “markdown”.
<code>display</code>	optional logical (defaults to <code>FALSE</code> ). This parameter specifies whether to display the table upon creation ( <code>TRUE</code> or <code>FALSE</code> ).
<code>include.rownames</code>	optional logical whether to include rownames or not.
<code>...</code>	additional arguments passed on to specific formatting types.

## Value

Invisibly returns the summary table, which can be used if the printing options available are not sufficient.

## Note

You must choose between `keepCols` and `dropCols` because it is not sensible to use these together to include and exclude columns. The function will error if you include both parameters.

testBParamCompoundConstraint

*Test inequality-constrained hypothesis for two or more parameters  
based on iterations of MCMC chains*

---

**Description**

Tests an inequality-constrained hypothesis (van de Schoot, Hoijsink, Hallquist, & Boelen, in press) based on draws from the posterior distribution of the model parameters, which provides information about the proportion of the distribution that is in agreement with a given hypothesis. This function is used for more complex hypotheses about three or more parameters, whereas testBParamConstraint tests a simple two-parameter hypothesis.

**Usage**

```
testBParamCompoundConstraint(bparams, test)
```

**Arguments**

<code>bparams</code>	An object containing draws from the posterior distribution (class <code>mplus.model</code> or <code>mplus.bparameters</code> ). Obtained by <code>SAVEDATA:BPARAMETERS</code> in Mplus and <code>getSavedata_Bparams</code> or <code>readModels</code> in MplusAutomation.
<code>test</code>	The R code defining the parameter test of three or more parameters. Example: <code>"(STAITOT.ON.CG &gt; STAITOT.ON.UGC) &amp; (BDIM.ON.CG &gt; BDIM.ON.UGC)"</code> .

**Details**

This function accepts a `bparameters` object containing iterations of the MCMC chains (rows) for each model parameter (columns) and prints out the number and proportion of draws that are consistent with the requested hypothesis test.

The `test` argument is evaluated directly as R code, with the `bparams` object attached so that variable names are available directly in the environment. Because the goal is to evaluate the test for each draw from the posterior distribution, remember to use vector-based logic operators, not boolean operators. That is, stick to `&` or `|` for joining tests of parameters, rather than `&&` or `||` since the latter will return a single TRUE/FALSE, which is irrelevant.

An example test in R logic would be `"(STAITOT.ON.CG > STAITOT.ON.UGC) & (BDIM.ON.CG > BDIM.ON.UGC)"`.

**Value**

No value is returned by this function. Instead, two summary tables are printed to the screen containing the number and proportion of draws consistent with the hypothesis.

**Author(s)**

Michael Hallquist

**Examples**

```
## Not run:
#using bparameters directly
btest <- getSavedata_Bparams("model vb1_simpel_b.out")
testBParametersCompoundConstraint(btest,
"(STDYX_STAITOT.ON.CG > STDYX_STAITOT.ON.UGC) & (STDYX_BDIM.ON.CG > STDYX_BDIM.ON.UGC)")

#or using readModels
btest <- readModels("model vb1_simpel_b.out")
testBParametersCompoundConstraint(btest,
"(STDYX_STAITOT.ON.CG > STDYX_STAITOT.ON.UGC) & (STDYX_BDIM.ON.CG > STDYX_BDIM.ON.UGC)")

## End(Not run)
```

---

testBParamConstraint	<i>Test inequality-constrained hypothesis for two parameters based on iterations of MCMC chains</i>
----------------------	---

---

## Description

Tests a simple inequality-constrained hypothesis (van de Schoot, Hoijtink, Hallquist, & Boelen, in press) based on draws from the posterior distribution of the model parameters, which provides information about the proportion of the distribution that is in agreement with a given hypothesis. This function is used for simple hypothesis for two parameters, whereas testBParamCompoundConstraint gives full access to multiple parameters and R's logic syntax. This function accepts a bparameters object containing iterations of the MCMC chains (rows) for each model parameter (columns) and prints out the number and proportion of draws that are consistent with the requested hypothesis test. The coef1, operator, and coef2 arguments are appended in sequence, so that the hypothesis test is constructed from left-to-right. e.g., testBParamConstraint(bparamsDF, "MGM.TRT1", ">", "MGM.EX2").

## Usage

```
testBParamConstraint(bparams, coef1, operator, coef2)
```

## Arguments

bparams	An object containing draws from the posterior distribution (class <code>mplus.model</code> or <code>mplus.bparameters</code> ). Obtained by <code>SAVEDATA:BPARAMETERS</code> in Mplus and <code>getSavedata_Bparams</code> or <code>readModels</code> in MplusAutomation.
coef1	The name of the first parameter to be compared. Example: "MGM.TRT1"
operator	A logical operator to compare the two parameters. Should be one of <code>&gt;=</code> , <code>&gt;</code> , <code>&lt;</code> , or <code>&lt;=</code> . Example: <code>&gt;=</code>
coef2	The name of the first parameter to be compared. Example: "MGM.EX2"

## Value

No value is returned by this function. Instead, two summary tables are printed to the screen containing the number and proportion of draws consistent with the hypothesis.

trainLGMM

*Train a variety of latent growth mixture model*

---

## Description

This function iterates through a grid of values to train LGMMs, optionally using a local or remote cluster.

## Usage

```
trainLGMM(
  data,
  idvar,
  assessmentvar,
  newdata = FALSE,
  tuneGrid,
  cl,
  ncores = 1L
)
```

## Arguments

data	A data frame or data table in long format (i.e., multiple rows per ID).
idvar	A character string of the variable name in the dataset that is the ID variable.
assessmentvar	A character string of the variable name in the dataset that indicates the particular assessment point for each timepoint.
newdata	A data frame of new values to use for generating predicted trajectories by class or FALSE if no predictions to be made (the default).
tuneGrid	A dataframe or list. It should have names for the needed arguments for long2LGMM().
cl	Optional. An existing cluster to be used to estimate models. Can be a local or remote cluster. In either case it needs MplusAUtomation and Mplus available.
ncores	If a cluster is not passed to cl, specify the number of cores to use to create a local cluster. Must be an integer. Defaults to 1L.

## Examples

```
## Not run:
## This example is not run by default because even with very limited number of
## random starts and iterations, it takes quite a few minutes
setwd(tempdir())

```

---

update.mplusObject	<i>Update an Mplus model object</i>
--------------------	-------------------------------------

---

## Description

This is a method for updating an Mplus model object. It takes an Mplus model object as the first argument, and then optionally any sections to update. There are two ways to update a section using a formula interface. `~ "new stuff"` will replace a given section with the new text. Alternately, you can add additional text using `~ + "additional stuff"`. Combined these let you replace or add to a section.

## Usage

```
## S3 method for class 'mplusObject'
update(object, quiet = TRUE, ...)
```

## Arguments

object	An object of class mplusObject
quiet	optional. If TRUE, show status messages in the console.
...	Additional arguments to pass on

## Value

An (updated) Mplus model object

## Author(s)

Joshua F. Wiley <jwiley.psych@gmail.com>

**Examples**

```
example1 <- mplusObject(MODEL = "mpg ON wt;",
  usevariables = c("mpg", "hp"), rdata = mtcars)
x <- ~ "ESTIMATOR = ML;"
str(update(example1, rdata = iris))
str(update(example1, ANALYSIS = x))
str(update(example1, MODEL = ~ "wt ON hp;"))
str(update(example1, MODEL = ~ . + "wt ON hp;"))
str(update(example1, ANALYSIS = x, MODEL = ~ . + "wt ON hp;"))

## check that use variables can be updated & overridden
str(update(example1, usevariables = c("mpg", "hp", "cyl")))

# test to make sure . in Mplus code does not cause problems
str(update(example1, ANALYSIS = x, MODEL = ~ . + "wt ON hp*.5;"))
rm(example1, x)
```
