# Package 'critpath'

July 22, 2025

Type Package

**Title** Setting the Critical Path in Project Management

Version 0.2.3

Maintainer Adam Kucharski <aqcharski@interia.pl>

## Description

Solving the problem of project management using CPM (Critical Path Method), PERT (Program Evaluation and Review Technique) and LESS (Least Cost Estimating and Scheduling) methods. The package sets the critical path, schedule and Gantt chart. In addition, it allows to draw a graph even with marked critical activities. For more information about project management see: Taha H. A. ``Operations Research. An Introduction" (2017, ISBN:978-1-292-16554-7), Rama Murthy P. ``Operations Research" (2007, ISBN:978-81-224-2944-2), Yuval Cohen & Arik Sadeh (2006) ``A New Approach for Constructing and Generating AOA Networks", Journal of Engineering, Computing and Architecture 1. 1-13, Konarzewska I., Jewczak M., Kucharski A. (2020, ISBN:978-83-8220-112-3), Miszczyńska D., Miszczyński M. ``Wybrane metody badań operacyjnych" (2000, ISBN:83-907712-0-9).

 ${\tt cpmexample1}$ 

Dataset for the CPM method

# Description

Index

Fictitious data that is used in the examples. 6 activities, 5 nodes. In this dataset, the activities occur on the edges.

# Usage

cpmexample1

## **Format**

A data frame composed of predetermined columns:

from starting activity nodeto final activity nodelabel activity labeltime duration of the activity

cpmexample2 3

cpmexample2

Dataset for the CPM method

#### **Description**

Example from Miszczyńska D., Miszczyński M. "Wybrane metody badań operacyjnych" (2000, ISBN:83-907712-0-9). 10 activities, 8 nodes. In this dataset, the activities occur on the edges and a list of direct predecessors has been added.

## Usage

cpmexample2

#### **Format**

A data frame composed of predetermined columns:

label activity labelpred preceding activities

time duration of the activity

lessexample1

Dataset for the LESS method

## Description

Fictitious data that is used in the examples. 6 activities, 5 nodes. In this dataset, the activities occur on the edges

## Usage

lessexample1

#### **Format**

A data frame composed of predetermined columns:

from starting activity node

to final activity node

label activity label

time normal duration of the activity

bound\_time the shortest duration of the activity

norm\_cost normal cost of the activity

bound\_cost boundary cost of the activity

4 pertexample1

lessexample2

Dataset for the LESS method

## **Description**

Example from Miszczyńska D., Miszczyński M. "Wybrane metody badań operacyjnych" (2000, ISBN:83-907712-0-9). In this dataset, the activities occur on the edges and a list of direct predecessors has been added.

## Usage

lessexample2

#### **Format**

A data frame composed of predetermined columns:

label activity label

pred preceding activities

time normal duration of the activity

bound\_time the shortest duration of the activity

**norm\_cost** normal cost of the activity

**bound\_cost** boundary cost of the activity

pertexample1

Dataset for the PERT method

## **Description**

Fictitious data that is used in the examples. 9 activities, 8 nodes. In this dataset, the activities occur on the edges

#### Usage

pertexample1

#### **Format**

A data frame composed of predetermined columns:

from starting activity node

to final activity node

label activity label

opt\_time optimistic duration of activity

likely\_time the most likely duration of the activity

pes\_time pesimistic duration of activity

pertexample2 5

pertexample2

Dataset for the PERT method

## Description

Example from Miszczyńska D., Miszczyński M. "Wybrane metody badań operacyjnych" (2000, ISBN:83-907712-0-9). 10 activities, 8 nodes. In this dataset, the activities occur on the edges and a list of direct predecessors has been added.

## Usage

```
pertexample2
```

#### **Format**

A data frame composed of predetermined columns:

label activity label
pred preceding activities
opt\_time optimistic duration of activity
likely\_time the most likely duration of the activity
pes\_time pesimistic duration of activity

PERT\_newprob

Probability for the given directive term

#### **Description**

Probability for the given directive term

#### Usage

```
PERT_newprob(new_DT, yourlist)
```

## **Arguments**

new\_DT The given project completion date. The parameter must be greater than zero.

yourlist List of objects that make up the solution to the project management problem.

#### Value

This function calculates the probability of completing the project within the time specified by the user. A normal distribution was assumed.

```
y <- solve_pathAOA(pertexample1, deterministic = FALSE)
PERT_newprob(new_DT = 30, y)</pre>
```

plot\_alap

PERT_newtime	A new directive term for any probability	

## Description

A new directive term for any probability

## Usage

```
PERT_newtime(new_prob = 0.5, yourlist)
```

## Arguments

new\_prob Probability of the project completion. Default set to 0.5.

yourlist List of objects that make up the solution to the project management problem.

## Value

This function computes a new directive term for a probability given by the user. A normal distribution was assumed.

#### **Examples**

```
y <- solve_pathAOA(pertexample1, deterministic = FALSE)
PERT_newtime(new_prob = 0.3, y)</pre>
```

plot\_alap

An ALAP chart

# Description

An ALAP chart

## Usage

```
plot_alap(yourlist, show_dummy = FALSE, bar_size = 10)
```

## **Arguments**

yourlist	List of objects that make up the solution to the project management problem.
show_dummy	Decides whether dummy activities should be included in the chart. If so, set it to TRUE (set to FALSE by default).

bar\_size Thickness of the bar drawn for activity (set to 10 by default).

plot\_asap 7

## Value

Draws an ALAP (activities start and finish As Late As Possible) chart broken down into critical ("CR") and non-critical ("NC") activities. Marks total float.

## **Examples**

```
x <- solve_pathAOA(cpmexample1, deterministic = TRUE)
plot_alap(x)</pre>
```

plot\_asap

An ASAP chart

## Description

An ASAP chart

## Usage

```
plot_asap(yourlist, show_dummy = FALSE, bar_size = 10)
```

## Arguments

yourlist	List of objects that make up the solution to the project management problem.
show_dummy	Decides whether dummy activities should be included in the chart. If so, set it to TRUE (set to FALSE by default).
bar_size	Thickness of the bar drawn for activity (set to 10 by default).

## Value

Draws an ASAP (activities start and finish As Soon As Possible) chart broken down into critical ("CR") and non-critical ("NC") activities. Marks total floats.

```
x <- solve_pathAOA(cpmexample1, deterministic = TRUE)
plot_asap(x)</pre>
```

8 plot\_graphAOA

|--|

#### **Description**

A Gantt chart

#### Usage

```
plot_gantt(yourlist, show_dummy = FALSE, bar_size = 10)
```

## **Arguments**

yourlist List of objects that make up the solution to the project management problem.

Show\_dummy Decides whether dummy activities should be included in the chart. If so, set it to TRUE (set to FALSE by default).

bar\_size Thickness of the bar drawn for activity (set to 10 by default).

## Value

Draws a Gantt chart broken down into critical ("CR") and non-critical ("NC") activities. Marks total floats.

## **Examples**

```
x <- solve_pathAOA(cpmexample1, deterministic = TRUE)
plot_gantt(x)</pre>
```

|--|

# Description

A graph of connections between nodes

## Usage

```
plot_graphAOA(input_data, predecessors = FALSE, solved = NULL, fixed_seed = 23)
```

## Arguments

input_data	Data frame describing the problem.
predecessors	TRUE if the user data contains a list of immediately preceding activities
solved	List of objects that make up the solution to the project management problem.
fixed_seed	Optional parameter setting random seed to user value to get similar looking plots
	each time the function is run (set to 23 by default).

plot\_norm 9

## Value

The function draws a graph showing dependencies between nodes. The "solved" parameter determines whether there is a critical path in the graph. In that case, you must solve the problem first. In the examples below, the function first draws the graph only on the basis of the data frame and then after determining the critical path.

## **Examples**

```
plot_graphAOA(cpmexample1)
x <- solve_pathAOA(cpmexample1, TRUE)
plot_graphAOA(solved = x)</pre>
```

plot\_norm

The cumulative distribution function of the normal distribution

## **Description**

The cumulative distribution function of the normal distribution

#### Usage

```
plot_norm(yourlist)
```

## **Arguments**

yourlist

List of objects making up the solution to the project management problem

## Value

Draws a graph of the normal distribution with the expected directive term from the PERT method and the standard deviation for this term. The chart also includes lines indicating the schedules of the risk-taker and the belayer.

```
y <- solve_pathAOA(pertexample1, deterministic = FALSE)
plot_norm(y)</pre>
```

10 solve\_lessAOA

plot\_TC

Total cost change plot

## Description

Total cost change plot

#### Usage

```
plot_TC(your_list)
```

### **Arguments**

your\_list

List containing solved problem

#### Value

Based on the results of the LESS method, a graph of the total cost value of all iterations is created

#### **Examples**

```
z <- solve_lessAOA(lessexample1, 50, 15)
plot_TC(z)</pre>
```

solve\_lessAOA

Determines the solution using the LESS method. Relationships between activities can be given as a list of predecessors or start and end node numbers.

## Description

Determines the solution using the LESS method. Relationships between activities can be given as a list of predecessors or start and end node numbers.

#### Usage

```
solve_lessAOA(input_data, ICconst, ICslope, predecessors = FALSE)
```

## Arguments

 $input\_data$ 

Data frame containing the graph structure and activity durations. For the LESS method and start/end nodes you need 7 columns (the order matters):

- 1. from The number of the node where the activity starts.
- 2. to The number of the node where the activity ends.
- 3. label Activity labels.
- 4. time Normal duration of activities.

solve\_pathAOA 11

- 5. crash\_time Crash (the shortest possible) duration of activities.
- 6. norm\_cost Normal costs.
- 7. crash\_cost Crash costs.

For the LESS method and predecessors list you need 6 columns (the order matters):

- 1. label Activity labels.
- 2. pred List of predecessors.
- 3. time Normal duration of activities.
- 4. crash\_time Crash (the shortest possible) duration of activities.
- 5. norm\_cost Normal costs.
- 6. crash\_cost Crash costs.

ICconst Intercept of the indirect cost function.

ICslope Slope of the indirect cost function.

predecessors TRUE if the user data contains a list of immediately preceding activities If set

to FALSE (default), start nad end nodes are used. If is set to TRUE, predecessors

list is used.

## Value

A list made of a graph and a result set.

#### **Examples**

```
z <- solve_lessAOA(lessexample1, 50, 15)</pre>
```

solve\_pathAOA

Finds a solution using CPM and PERT methods. Relationships between activities can be given as a list of predecessors or start and end node numbers.

## **Description**

Finds a solution using CPM and PERT methods. Relationships between activities can be given as a list of predecessors or start and end node numbers.

## Usage

```
solve_pathAOA(
   input_data,
   deterministic = TRUE,
   predecessors = FALSE,
   pert_param = 0
)
```

12 solve\_pathAOA

#### **Arguments**

input\_data

Data frame containing the structure of the graph and the duration of the activity. For the CPM method and start/end nodes you need 4 columns (the order is important, not the name of the column):

- 1. from The number of the node where the activity starts.
- 2. to The number of the node where the activity ends.
- 3. label Activity labels.
- 4. time Activities durations.

For the CPM method and predecessors list you need 3 columns (the order is important, not the name of the column):

- 1. label Activity labels.
- 2. pred List of predecessors.
- 3. time Activities durations.

For the PERT method and start/end nodes you need 6 columns (the order is important, not the name of the column):

- 1. from The number of the node where the activity starts.
- 2. to The number of the node where the activity ends.
- 3. label Activity labels.
- 4. opt\_time Optimistic duration of activities.
- 5. likely\_time The most likely duration of the activity.
- 6. pes\_time Pessimistic duration of activities.

For the PERT method and predecessors list you need 5 columns (the order is important, not the name of the column):

- 1. label Activity labels.
- 2. pred List of predecessors.
- 3. opt\_time Optimistic duration of activities.
- 4. likely\_time The most likely duration of the activity.
- 5. pes\_time Pessimistic duration of activities.

deterministic

A logical parameter specifying the solution method. If set to TRUE (default), the CPM method is used. If is set to FALSE, the PERT method is used.

predecessors

TRUE if the user data contains a list of immediately preceding activities If set to FALSE (default), start nad end nodes are used. If is set to TRUE, predecessors list is used.

pert\_param

A parameter that controls the method of calculating the expected value and variance in the PERT method. 0 - classic formula (default), 1 - 1st and 99th percentile of the beta distribution, 2 - 5th and 95th percentile of the beta distribution, 3 - 5th and 95th percentiles of the beta distribution with modification by (Perry and Greig, 1975), 4 - Extended Pearson's and Tukey's formula (Pearson and Tukey, 1965), 5 - Golenko-Ginzburg's full formula (Golenko-Ginzburg, 1988), 6 - Golenko-Ginzburg's reduced formula (Golenko-Ginzburg, 1988), 7 - Farnum's and Stanton's formula (Farnum and Stanton, 1987).

solve\_pathAOA 13

## Value

The list is made of a graph, schedule and selected partial results.

```
x <- solve_pathAOA(cpmexample1, deterministic = TRUE)
y <- solve_pathAOA(pertexample1, deterministic = FALSE)
x <- solve_pathAOA(cpmexample2, deterministic = TRUE, predecessors = TRUE)
y <- solve_pathAOA(pertexample2, deterministic = FALSE, predecessors = TRUE)</pre>
```
