Package 'dataverifyr'

July 22, 2025

Type Package

Title A Lightweight, Flexible, and Fast Data Validation Package that Can Handle All Sizes of Data

Version 0.1.8

Description Allows you to define rules which can be used to verify a given dataset.
The package acts as a thin wrapper around more powerful data packages such as 'dplyr', 'data.table', 'arrow', and 'DBI' ('SQL'), which do the heavy lifting.

URL https://github.com/DavZim/dataverifyr, https://davzim.github.io/dataverifyr/

BugReports https://github.com/DavZim/dataverifyr/issues

Imports yaml

Suggests arrow, data.table, DBI, dplyr, dbplyr, duckdb, RSQLite, testthat (>= 3.0.0)

Config/testthat/edition 3

Encoding UTF-8

RoxygenNote 7.2.3

NeedsCompilation no

Author David Zimmermann-Kollenda [aut, cre], Beniamino Green [ctb]

`bind_rules` *Programatically Combine a List of Rules and Rulesets into a Single Ruleset*

Description

Programatically Combine a List of Rules and Rulesets into a Single Ruleset

Usage

```
bind_rules(rule_ruleset_list)
```

Arguments

`rule_ruleset_list`
: a list of rules and rulesets you whish to combine into a single list

Value

a ruleset which consolidates all the inputs

`check_data` *Checks if a dataset confirms to a given set of rules*

Description

Checks if a dataset confirms to a given set of rules

Usage

```
check_data(
  x,
  rules,
  xname = deparse(substitute(x)),
  stop_on_fail = FALSE,
  stop_on_warn = FALSE,
  stop_on_error = FALSE
)
```

Arguments

x	a dataset, either a data.frame, dplyr::tibble, data.table::data.table, arrow::arrow_table, arrow::open_dataset, or dplyr::tbl (SQL connection)
rules	a list of rules
xname	optional, a name for the x variable (only used for errors)
stop_on_fail	when any of the rules fail, throw an error with stop
stop_on_warn	when a warning is found in the code execution, throw an error with stop
stop_on_error	when an error is found in the code execution, throw an error with stop

Value

a data.frame-like object with one row for each rule and its results

See Also

detect_backend()

Examples

```
rs <- ruleset(
  rule(mpg > 10),
  rule(cyl %in% c(4, 6)), # missing 8
  rule(qsec >= 14.5 & qsec <= 22.9)
)
rs

check_data(mtcars, rs)
```

---

dataverifyr_plus *Add Rules and Rulesets Together*

Description

- allows you to add rules and rulesets into larger rulesets. This can be useful if you want to create a ruleset for a dataset out of checks for other datasets.

Usage

```
datavarifyr_plus(a, b)

## S3 method for class 'ruleset'
a + b

## S3 method for class 'rule'
a + b
```

Arguments

a	the first ruleset you wish to add
b	the second ruleset you wish to add

`detect_backend` *Detects the backend which will be used for checking the rules*

Description

The detection will be made based on the class of the object as well as the packages installed. For example, if a `data.frame` is used, it will look if `data.table` or `dplyr` are installed on the system, as they provide more speed. Note the main functions will revert the

Usage

```
detect_backend(x)
```

Arguments

x	The data object, ie a data.frame, tibble, data.table, arrow, or DBI object

Value

a single character element with the name of the backend to use. One of `base-r`, `data.table`, `dplyr`, `collectibles` (for arrow or DBI objects)

See Also

`check_data()`

Examples

```
data <- mtcars
detect_backend(data)
```

`filter_fails` *Filters a result dataset for the values that failed the verification*

Description

Filters a result dataset for the values that failed the verification

Usage

```
filter_fails(res, x, per_rule = FALSE)
```

Arguments

`res`	a result data.frame as outputted from `check_data()` or a ruleset
`x`	a dataset that was used in `check_data()`
`per_rule`	if set to TRUE, a list of filtered data is returned, one for each failed verification rule. If set to FALSE, a data.frame is returned of the values that fail any rule.

Value

the dataset with the entries that did not match the given rules

Examples

```
rules <- ruleset(
  rule(mpg > 10 & mpg < 30), # mpg goes up to 34
  rule(cyl %in% c(4, 8)), # missing 6 cyl
  rule(vs %in% c(0, 1), allow_na = TRUE)
)

res <- check_data(mtcars, rules)

filter_fails(res, mtcars)
filter_fails(res, mtcars, per_rule = TRUE)

# alternatively, the first argument can also be a ruleset
filter_fails(rules, mtcars)
filter_fails(rules, mtcars, per_rule = TRUE)
```

plot_res *Visualize the results of a data validation*

Description

Visualize the results of a data validation

Usage

```
plot_res(
  res,
  main = "Verification Results per Rule",
  colors = c(pass = "#308344", fail = "#E66820"),
  labels = TRUE,
  table = TRUE
)
```

Arguments

res	a data.frame as returned by check_data()
main	the title of the plot
colors	a named list of colors, with the names pass and fail
labels	whether the values should be displayed on the barplot
table	show a table in the legend with the values

Value

a base r plot

Examples

```
rs <- ruleset(
  rule(Ozone > 0 & Ozone < 120, allow_na = TRUE), # some mising values and > 120
  rule(Solar.R > 0, allow_na = TRUE),
  rule(Solar.R < 200, allow_na = TRUE),
  rule(Wind > 10),
  rule(Temp < 100)
)

res <- check_data(airquality, rs)
plot_res(res)
```

`rule` *Creates a single data rule*

Description

Creates a single data rule

Usage

```
rule(expr, name = NA, allow_na = FALSE, negate = FALSE, ...)

## S3 method for class 'rule'
print(x, ...)
```

Arguments

`expr`	an expression which dictates which determines when a rule is good. Note that the expression is evaluated in `check_data()`, within the given framework. That means, for example if a the data given to `check_data()` is an `arrow` dataset, the expression must be mappable from `arrow` (see also arrow documentation). The expression can be given as a string as well.
`name`	an optional name for the rule for reference
`allow_na`	does the rule allow for NA values in the data? default value is FALSE. Note that when NAs are introduced in the expression, `allow_na` has no effect. Eg when the rule `as.numeric(vs) %in% c(0, 1)` finds the values of `vs` as `c("1", "A")`, the rule will throw a fail regardless of the value of `allow_na` as the NA is introduced in the expression and is not found in the original data. However, when the values of `vs` are `c("1", NA)`, `allow_na` will have an effect.
`negate`	is the rule negated, only applies to the expression not allow_na, that is, if `expr = mpg > 10`, `allow_na = TRUE`, and `negate = TRUE`, it would match all `mpg <= 10` as well as NAs.
`...`	additional arguments that are carried along for your documentation, but are not used. Could be for example date, person, contact, comment, etc
`x`	a rule to print

Value

The rule values as a list

Methods (by generic)

- `print(rule)`: Prints a rule

Examples

```
r <- rule(mpg > 10)
r

r2 <- rule(mpg > 10, name = "check that mpg is reasonable", allow_na = TRUE,
           negate = FALSE, author = "me", date = Sys.Date())
r2

check_data(mtcars, r)

rs <- ruleset(
  rule(mpg > 10),
  rule(cyl %in% c(4, 6)), # missing 8
  rule(qsec >= 14.5 & qsec <= 22.9)
)
rs
check_data(mtcars, rs)
```

---

ruleset *Creates a set of rules*

Description

Creates a set of rules

Usage

```
ruleset(...)

## S3 method for class 'ruleset'
print(x, n = 3, ...)
```

Arguments

...	a list of rules
x	a ruleset to print
n	a maximum number of rules to print

Value

the list of rules as a ruleset

Methods (by generic)

- `print(ruleset)`: Prints a ruleset

Examples

```
r1 <- rule(mpg > 10)
r2 <- rule(mpg < 20)
rs <- ruleset(r1, r2)
rs

rs <- ruleset(
  rule(cyl %in% c(4, 6, 8)),
  rule(is.numeric(disp))
)
rs
```

`write_rules` *Read and write rules to a yaml file*

Description

Read and write rules to a yaml file

Usage

```
write_rules(x, file)

read_rules(file)
```

Arguments

`x`	a list of rules
`file`	a filename

Value

the filename invisibly

Functions

- `read_rules()`: reads a ruleset back in

Examples

```
rr <- ruleset(
  rule(mpg > 10),
  rule(cyl %in% c(4, 6, 8))
)
file <- tempfile(fileext = ".yml")
write_rules(rr, file)
```
