Package 'iterLap'

July 22, 2025

Type Package

Title Approximate Probability Densities by Iterated Laplace Approximations	
Version 1.1-4	
Depends quadprog, randtoolbox, parallel, R (>= 2.15)	
Date 2023-09-29	
Author Bjoern Bornkamp	
Maintainer Bjoern Bornkamp bbnkmp@mail.de>	
Description The iterLap (iterated Laplace approximation) algorithm approximates a general (possibly non-normalized) probability density on R^p, by repeated Laplace approximations to the difference between current approximation and true density (on log scale). The final approximation is a mixture of multivariate normal distributions and might be used for example as a proposal distribution for importance sampling (eg in Bayesian applications). The algorithm can be seen as a computational generalization of the Laplace approximation suitable for skew or multimodal densities.

2 iterLap-package

iterLap-package

iterLap package information

Description

Implementation of iterLap

Details

This package implements the multiple mode Laplace approximation by Gelman and Rubin (via function GRApprox) and the iterated Laplace approximation (via the function iterLap). Both functions return objects of class mixDist, which contain the fitted mode vectors and covariance matrices. Print and summary methods exist to display the contents of a mixDist object in human-readable form. Function IS performs importance sampling, using a mixDist object as input parameter.

Examples

```
## banana example
banana <- function(pars, b, sigma12){</pre>
 dim <- 10
  y <- c(pars[1], pars[2]+b*(pars[1]^2-sigma12), pars[3:dim])</pre>
  cc <- c(1/sqrt(sigma12), rep(1, dim-1))</pre>
  return(-0.5*sum((y*cc)^2))
}
start <- rbind(rep(0,10),rep(-1.5,10),rep(1.5,10))
## multiple mode Laplace approximation
gr <- GRApprox(banana, start, b = 0.03, sigma12 = 100)</pre>
## print mixDist object
## summary method
summary(gr)
## importance sampling using the obtained mixDist object
## using a mixture of t distributions with 10 degrees of freedom
issamp \leftarrow IS(gr, nSim=1000, df = 10, post=banana, b = 0.03,
             sigma12 = 100)
## effective sample size
issamp$ESS
```

GRApprox 3

GRApprox

Gelman-Rubin mode approximation

Description

Performs the multiple mode approximation of Gelman-Rubin (applies a Laplace approximation to each mode). The weights are determined corresponding to the height of each mode.

Usage

Arguments

post	log-posterior density.
start	vector of starting values if dimension=1 otherwise matrix of starting values with the starting values in the rows
grad	gradient of log-posterior
method	Which optimizer to use
control	Control list for the chosen optimizer
	Additional arguments for log-posterior density specified in post

Value

Produces an object of class mixDist. That a list mit entries weights Vector of weights for individual components means Matrix of component medians of components sigmas List containing scaling matrices eigenHess List containing eigen decompositions of scaling matrices dets Vector of determinants of scaling matrix sigmainv List containing inverse scaling matrices

Examples

```
## log-density for banana example
banana <- function(pars, b, sigma12){</pre>
 dim <- 10
 y <- c(pars[1], pars[2]+b*(pars[1]^2-sigma12), pars[3:dim])</pre>
 cc <- c(1/sqrt(sigma12), rep(1, dim-1))</pre>
  return(-0.5*sum((y*cc)^2))
}
start <- rbind(rep(0,10),rep(-1.5,10),rep(1.5,10))
## multiple mode Laplace approximation
aa <- GRApprox(banana, start, b = 0.03, sigma12 = 100)
## print mixDist object
aa
## summary method
summary(aa)
## importance sampling using the obtained mixDist object
## using a mixture of t distributions with 10 degrees of freedom
dd <- IS(aa, nSim=1000, df = 10, post=banana, b = 0.03,
         sigma12 = 100)
## effective sample size
dd$ESS
```

 $\label{thm:montance} \mbox{Importance Sampling and independence Metropolis Hastings sampling} \\ \mbox{\it Monte Carlo sampling using the iterated Laplace approximation}.$

Description

Use iterated Laplace approximation as a proposal for importance sampling or the independence Metropolis Hastings algorithm.

Usage

```
IS(obj, nSim, df = 4, post, vectorized = FALSE, cores = 1, ...)
IMH(obj, nSim, df = 4, post, vectorized = FALSE, cores = 1, ...)
```

iterLap 5

Arguments

obj an object of class "mixDist"
nSim number of simulations

df degrees of freedom of the mixture of t distributions proposal

post log-posterior density

vectorized Logical determining, whether post is vectorized

cores number of cores you want to use to evaluate the target density (uses the mclapply

function from the parallel package). For Windows machines, a value > 1 will

have no effect, see mclapply help for details.

... additional arguments passed to post.

Value

A list with entries:

samp: Matrix containing sampled values w: Vector of weights for values in samp

normconst: normalization constant estimated based on importance sampling

ESS: Effective sample size (for IS) accept: Acceptance rate (for IMH)

Author(s)

Bjoern Bornkamp

Examples

see function iterLap for an example on how to use IS and IMH

iterLap Iterated Laplace Approximation

Description

Iterated Laplace Approximation

Usage

```
iterLap(post, ..., GRobj = NULL, vectorized = FALSE, startVals = NULL,
    method = c("nlminb", "nlm", "Nelder-Mead", "BFGS"), control = NULL,
    nlcontrol = list())
```

6 iterLap

Arguments

post log-posterior density

... additional arguments to log-posterior density

GRobj object of class mixDist, for example resulting from a call to GRApprox

vectorized Logical determining, whether post is vectorized

startVals Starting values for GRApprox, when GRobj is not specified. Vector of start-

ing values if dimension=1 otherwise matrix of starting values with the starting

values in the rows

method Type of optimizer to be used.

control List with entries:

gridSize Determines the size of the grid for each component delta Stopping criterion based on the maximum error on the grid maxDim Maximum number of components allowed (default 20)

eps Stopping criterion based on normalization constant of approximation info How much information should be displayed during iterations: 0 - none, 1

- minimum information, 2 - maximum information

nlcontrol Control list for the used optimizer.

Value

Produces an object of class mixDist: A list with entries weights Vector of weights for individual components means Matrix of component medians of components sigmas List containing scaling matrices eigenHess List containing eigen decompositions of scaling matrices dets Vector of determinants of scaling matrix sigmainv List containing inverse scaling matrices

               sigma12 = 100)
 imObj2$accept
 plot(imObj2\$samp[,1], imObj2\$samp[,2], xlim=c(-40,40), ylim = c(-40,20))
 ## IMH and IS can exploit multiple cores, example for two cores
 ## Not run:
 isObj3 <- IS(iL, nSim=10000, df = 100, post=banana, b = 0.03,
              sigma12 = 100, cores = 2)
## End(Not run)
```

resample

Residual resampling

Description

Perform residual resampling to the result of importance sampling

8 resample

Usage

```
resample(n, obj)
```

Arguments

n Number of resamples to draw

obj An object of class IS, as produced by the IS function

Value

Matrix with resampled values

Author(s)

Bjoern Bornkamp
