

Package ‘rebmix’

July 23, 2025

Version 2.16.0

Title Finite Mixture Modeling, Clustering & Classification

Description Random univariate and multivariate finite mixture model generation, estimation, clustering, latent class analysis and classification. Variables can be continuous, discrete, independent or dependent and may follow normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or circular von Mises parametric families.

adult

*Adult Dataset***Description**

The adult dataset containing 48842 instances with 16 continuous, binary and discrete variables was extracted from the census bureau database. Extraction was done by Barry Becker from the 1994 census bureau database.

Usage

```
data(adult)
```

Format

adult is a data frame with 48842 cases (rows) and 16 variables (columns) named:

1. Type binary train or test.
2. Age continuous.
3. Workclass one of the 8 discrete values private, self-emp-not-inc, self-emp-inc, federal-gov, local-gov, state-gov, without-pay or never-worked.
4. Fnlwgt stands for continuous final weight.
5. Education one of the 16 discrete values bachelors, some-college, 11th, hs-grad, prof-school, assoc-acdm, assoc-voc, 9th, 7th-8th, 12th, masters, 1st-4th, 10th, doctorate, 5th-6th or preschool.
6. Education.Num continuous.
7. Marital.Status one of the 7 discrete values married-civ-spouse, divorced, never-married, separated, widowed, married-spouse-absent or married-af-spouse.
8. Occupation one of the 14 discrete values tech-support, craft-repair, other-service, sales, exec-managerial, prof-specialty, handlers-cleaners, machine-op-inspct, adm-clerical, farming-fishing, transport-moving, priv-house-serv, protective-serv or armed-forces.
9. Relationship one of the 6 discrete values wife, own-child, husband, not-in-family, other-relative or unmarried.
10. Race one of the 5 discrete values white, asian-pac-islander, amer-indian-eskimo, other or black.
11. Sex binary female or male.
12. Capital.Gain continuous.
13. Capital.Loss continuous.
14. Hours.Per.Week continuous.
15. Native.Country one of the 41 discrete values united-states, cambodia, england, puerto-rico, canada, germany, outlying-us(guam-usvi-etc), india, japan, greece, south, china, cuba, iran, honduras, philippines, italy, poland, jamaica, vietnam, mexico, portugal, ireland, france, dominican-republic, laos, ecuador, taiwan, haiti, columbia, hungary, guatemala, nicaragua, scotland, thailand, yugoslavia, el-salvador, trinidad&tobago, peru, hong or holand-netherlands.
16. Income binary <=50k or >50k.

```

AIC-methods

Akaike Information Criterion

Description

Returns the Akaike information criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
AIC(x = NULL, pos = 1, ...)
## S4 method for signature 'REBMIX'
AIC3(x = NULL, pos = 1, ...)
## S4 method for signature 'REBMIX'
AIC4(x = NULL, pos = 1, ...)
## S4 method for signature 'REBMIX'
AICc(x = NULL, pos = 1, ...)
## S4 method for signature 'REBMIX'
CAIC(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

AWE-methods

Approximate Weight of Evidence Criterion

Description

Returns the approximate weight of evidence criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
AWE(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

`signature(x = "REBMIX")` an object of class REBMIX.

`signature(x = "REBMVNORM")` an object of class REBMVNORM.

bearings

Bearings Faults Detection Data

Description

These data are the results of the extraction process from the vibrational data of healthy and faulty bearings. Different faults are considered: faultless (1), defect on outer race (2), defect on inner race (3) and defect on ball (4). The extracted features are: root mean square (RMS), square root of the amplitude (SRA), kurtosis value (KV), skewness value (SV), peak to peak value (PPV), crest factor (CF), impulse factor (IF), margin factor (MF), shape factor (SF), kurtosis factor (KF), frequency centre (FC), root mean square frequency (RMSF) and root variance frequency (RVF).

Usage

```
data(bearings)
```

Format

`bearings` is a data frame with 1906 cases (rows) and 14 variables (columns) named:

1. RMS continuous.
2. SRA continuous.
3. KV continuous.
4. SV continuous.
5. PPV continuous.
6. CF continuous.
7. IF continuous.
8. MF continuous.
9. SF continuous.
10. KF continuous.
11. FC continuous.
12. RMSF continuous.
13. RVF continuous.
14. Class discrete 1, 2, 3 or 4.

Examples

```
## Not run:
data(bearings)

# Split dataset into train (75

set.seed(3)

Bearings <- split(p = 0.75, Dataset = bearings, class = 14)

# Estimate number of components, component weights and component
# parameters for train subsets.

bearingsest <- REBMIX(model = "REBMVNORM",
  Dataset = a.train(Bearings),
  Preprocessing = "histogram",
  cmax = 15,
  Criterion = "BIC")

# Classification.

bearingscla <- RCLSMIX(model = "RCLSMVNORM",
  x = list(bearingsest),
  Dataset = a.test(Bearings),
  Zt = a.Zt(Bearings))

bearingscla

summary(bearingscla)

## End(Not run)
```

Description

Returns as default the optimized RCLSMIX algorithm output for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities. If model equals "RCLSMVNORM" optimized output for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices is returned.

Usage

```
## S4 method for signature 'RCLSMIX'
BFSMIX(model = "RCLSMIX", x = list(), Dataset = data.frame(),
        Zt = factor(), ...)
## ... and for other signatures
```

Arguments

model	see Methods section below.
x	a list of objects of class REBMIX of length o obtained by running REBMIX on $g = 1, \dots, s$ train datasets $Y_{\text{train}g}$ all of length $n_{\text{train}g}$. For the train datasets the corresponding class membership Ω_g is known. This yields $n_{\text{train}} = \sum_{g=1}^s n_{\text{train}g}$, while $Y_{\text{train}q} \cap Y_{\text{train}g} = \emptyset$ for all $q \neq g$. Each object in the list corresponds to one chunk, e.g., $(y_{1j}, y_{3j})^\top$. The default value is <code>list()</code> .
Dataset	a data frame containing test dataset Y_{test} of length n_{test} . For the test dataset the corresponding class membership Ω_g is not known. The default value is <code>data.frame()</code> .
Zt	a factor of true class membership Ω_g for the test dataset. The default value is <code>factor()</code> .
...	currently not used.

Value

Returns an optimized object of class RCLSMIX or RCLSMVNORM.

Methods

`signature(model = "RCLSMIX")` a character giving the default class name "RCLSMIX" for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities.

`signature(model = "RCLSMVNORM")` a character giving the class name "RCLSMVNORM" for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

BIC-methods

Bayesian Information Criterion

Description

Returns the Bayesian information criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
BIC(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

Author(s)

Marko Nagode

References

G. Schwarz. Estimating the dimension of the model. The Annals of Statistics, 6(2):461-464, 1978.

Description

Returns the list of data frames containing bin means $\bar{y}_1, \dots, \bar{y}_v$ and frequencies $k_1, \dots, k_v$ for the histogram preprocessing.

Usage

```
## S4 method for signature 'list'
bins(Dataset = list(), K = matrix(),
      ymin = numeric(), ymax = numeric(), ...)
## ... and for other signatures
```

Arguments

Dataset	a list of length n_D of data frames of size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.
K	a matrix of size $n_D \times d$ containing numbers of bins $v_1, \dots, v_d$ for the histogram. If, e.g., $K = \text{matrix}(c(10, 15, 18, 5, 7, 9), \text{byrow} = \text{TRUE}, \text{ncol} = 3)$ than $d = 3$ and the list Dataset contains $n_D = 2$ data frames. Hence, different numbers of bins can be assigned to $y_1, \dots, y_d$. The default value is <code>matrix()</code> .
ymin	a vector of length d containing minimum observations. The default value is <code>numeric()</code> .
ymax	a vector of length d containing maximum observations. The default value is <code>numeric()</code> .
...	currently not used.

Methods

`signature(x = "list")` a list of data frames.

Examples

```
# Generate multivariate normal datasets.

n <- c(7, 10)

Theta <- new("RNGMVNORM.Theta", c = 2, d = 2)

a.theta1(Theta, 1) <- c(8, 6)
a.theta1(Theta, 2) <- c(6, 8)
a.theta2(Theta, 1) <- c(8, 2, 2, 4)
a.theta2(Theta, 2) <- c(2, 1, 1, 4)

sim2d <- RNGMIX(model = "RNGMVNORM",
  Dataset.name = paste("sim2d_", 1:2, sep = ""),
  rseed = -1,
  n = n,
  Theta = a.Theta(Theta))

# Calculate optimal numbers of bins.

opt.k <- optbins(Dataset = sim2d@Dataset,
  Rule = "Knuth equal",
  kmin = 1,
  kmax = 20)

opt.k

Y <- bins(Dataset = sim2d@Dataset, K = opt.k)

Y

opt.k <- optbins(Dataset = sim2d@Dataset,
  Rule = "Knuth unequal",
  kmin = 1,
  kmax = 20)

opt.k

Y <- bins(Dataset = sim2d@Dataset, K = opt.k)

Y
```

boot-methods

Parametric or Nonparametric Bootstrap for Standard Error and Coefficient of Variation Estimation

Description

Returns as default the boot output for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities. If

`x` is of class `RNGMVNORM` the boot output for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices is returned.

Usage

```
## S4 method for signature 'REBMIX'
boot(x = NULL, rseed = -1, pos = 1, Bootstrap = "parametric",
     B = 100, n = numeric(), replace = TRUE, prob = numeric(), ...)
## ... and for other signatures
## S4 method for signature 'REBMIX.boot'
summary(object, ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>rseed</code>	set the random seed to any negative integer value to initialize the sequence. The first bootstrap dataset corresponds to it. For each next bootstrap dataset the random seed is decremented $r_{\text{seed}} = r_{\text{seed}} - 1$. The default value is -1.
<code>pos</code>	a desired row number in <code>x@summary</code> to be bootstrapped. The default value is 1.
<code>Bootstrap</code>	a character giving the bootstrap type. One of default "parametric" or "nonparametric".
<code>B</code>	number of bootstrap datasets. The default value is 100.
<code>n</code>	number of observations. The default value is <code>numeric()</code> .
<code>replace</code>	logical. The sampling is with replacement if TRUE, see also sample . The default value is TRUE.
<code>prob</code>	a vector of length n containing probability weights, see also sample . The default value is <code>numeric()</code> .
<code>...</code>	maximum number of components <code>cmax</code> , minimum number of components <code>cmin</code> and further arguments to sample ; additional arguments affecting the summary produced.
<code>object</code>	see Methods section below.

Value

Returns an object of class `REBMIX.boot` or `REBMVNORM.boot`.

Methods

`signature(x = "REBMIX")` an object of class `REBMIX` for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities.

`signature(x = "REBMVNORM")` an object of class `REBMVNORM` for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

`signature(object = "REBMIX")` an object of class `REBMIX`.

`signature(object = "REBMVNORM")` an object of class `REBMVNORM`.

Author(s)

Marko Nagode

References

G. McLachlan and D. Peel. Finite Mixture Models. John Wiley & Sons, New York, 2000.

Examples

```
## Not run:
data(weibull)

# Create object of class EM.Control.

EM <- new("EM.Control", strategy = "single", variant = "EM",
  acceleration = "fixed", acceleration.multiplier = 1.0, tolerance = 1.0E-4,
  maximum.iterations = 1000)

# Estimate number of components, component weights and component parameters.

weibullest <- REBMIX(Dataset = list(weibull),
  Preprocessing = "kernel density estimation",
  cmin = 2,
  cmax = 4,
  Criterion = "BIC",
  pdf = "Weibull",
  EMcontrol = EM)

# Plot finite mixture.

plot(weibullest, what = c("pdf", "marginal cdf", "IC", "logL", "D"),
  nrow = 3, ncol = 2, npts = 1000)

# Bootstrap finite mixture.

weibullboot <- boot(x = weibullest, Bootstrap = "nonparametric", B = 10)

weibullboot

## End(Not run)
```

Description

Returns an object of class Histogram. The method can be called recursively. This way more than one dataset can be binned into one histogram. The method is time consuming.

Usage

```
## S4 method for signature 'Histogram'
chistogram(x = NULL, Dataset = data.frame(),
           K = numeric(), ymin = numeric(), ymax = numeric(), ...)
## ... and for other signatures
```

Arguments

<code>x</code>	an object of class <code>Histogram</code> .
<code>Dataset</code>	a data frame of size $n \times d$ containing d -dimensional dataset. Each of the d columns represents one random variable. Number of observations n equals the number of rows in the dataset.
<code>K</code>	an integer or a vector of length d containing numbers of bins v .
<code>ymin</code>	a vector of length d containing minimum observations.
<code>ymax</code>	a vector of length d containing maximum observations.
<code>...</code>	currently not used.

Methods

`signature(x = "Histogram")` an object of class `Histogram`.

Author(s)

Marko Nagode

Examples

```
# Create three datasets.

set.seed(1)

n <- 15

Dataset1 <- as.data.frame(cbind(rnorm(n, 157, 8), rnorm(n, 71, 10)))
Dataset2 <- as.data.frame(cbind(rnorm(n, 244, 14), rnorm(n, 61, 29)))
Dataset3 <- as.data.frame(cbind(rnorm(n, 198, 8), rnorm(n, 252, 13)))

apply(Dataset1, 2, range)
apply(Dataset2, 2, range)
apply(Dataset3, 2, range)

# Bin the first dataset.

hist <- chistogram(Dataset = Dataset1, K = c(4, 5), ymin = c(100.0, 0.0), ymax = c(300.0, 300.0))

# Bin the second dataset.

hist <- chistogram(x = hist, Dataset = Dataset2)
```

```
# Bin the third dataset.

hist <- chistogram(x = hist, Dataset = Dataset3)

hist
```

chunk-methods

Extracts Chunk from Train and Test Datasets

Description

Returns (invisibly) the object containing train and test observations $\mathbf{x}_1, \dots, \mathbf{x}_n$ as well as true class membership Ω_g for the test dataset. Vectors $\mathbf{x}$ are subvectors of $\mathbf{y} = (y_1, \dots, y_d)^\top$.

Usage

```
## S4 method for signature 'RCLS.chunk'
chunk(x = NULL, variables = expression(1:d))
## ... and for other signatures
```

Arguments

x	see Methods section below.
variables	a vector containing indices of variables in subvectors $\mathbf{x}$. The default value is 1:d.

Value

Returns an object of class RCLS.chunk.

Methods

signature(x = "RCLS.chunk") an object of class RCLS.chunk.

Author(s)

Marko Nagode

Examples

```
data(iris)

# Split dataset into train (75%) and test (25%) subsets.

set.seed(5)

Iris <- split(p = 0.75, Dataset = iris, class = 5)

# Extract chunk from train and test datasets.
```

```
Iris14 <- chunk(x = Iris, variables = c(1,4))

Iris14
```

CLC-methods

Classification Likelihood Criterion

Description

Returns the classification likelihood criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
CLC(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

Author(s)

Marko Nagode

References

C. Biernacki and G. Govaert. Using the classification likelihood to choose the number of clusters. In E. J. Wegman and S. P. Azen, editors, *Computing Science and Statistics*, 1997.

Description

Returns the data frame containing observations $x_1, \dots, x_n$ and empirical densities $f_1, \dots, f_n$ for the kernel density estimation or k -nearest neighbour or bin means $\bar{x}_1, \dots, \bar{x}_v$ and empirical densities $f_1, \dots, f_v$ for the histogram preprocessing. Vectors x and $\bar{x}$ are subvectors of $y = (y_1, \dots, y_d)^\top$ and $\bar{y} = (\bar{y}_1, \dots, \bar{y}_d)^\top$.

Usage

```
## S4 method for signature 'REBMIX'
demix(x = NULL, pos = 1, variables = expression(1:d), ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>pos</code>	a desired row number in <code>x@summary</code> for which the empirical densities are calculated. The default value is 1.
<code>variables</code>	a vector containing indices of variables in subvectors x or $\bar{x}$. The default value is <code>1:d</code> .
<code>...</code>	currently not used.

Methods

`signature(x = "REBMIX")` an object of class REBMIX.
`signature(x = "REBMVNORM")` an object of class REBMVNORM.

opar <- plot(simulatedest, pos = 3, nrow = 3, ncol = 1)

par(usr = opar[[2]]$usr, mfg = c(2, 1))

text(x = f[, 1], y = f[, 2], labels = format(f[, 3], digits = 3), cex = 0.8, pos = 1)

```

Description

Returns the data frame containing observations $\mathbf{x}_1, \dots, \mathbf{x}_n$ and predictive marginal densities $f(\mathbf{x}|c, \mathbf{w}, \Theta)$. Vectors $\mathbf{x}$ are subvectors of $\mathbf{y} = (y_1, \dots, y_d)^\top$. If $\mathbf{x} = \mathbf{y}$ the method returns the data frame containing observations $\mathbf{y}_1, \dots, \mathbf{y}_n$ and the corresponding predictive mixture densities $f(\mathbf{y}|c, \mathbf{w}, \Theta)$.

Usage

```
## S4 method for signature 'REBMIX'
dfmix(x = NULL, Dataset = data.frame(), pos = 1, variables = expression(1:d), ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>Dataset</code>	a data frame containing observations $\mathbf{y} = (y_1, \dots, y_d)^\top$ for which the predictive marginal densities are calculated. The default value is <code>data.frame()</code> .
<code>pos</code>	a desired row number in <code>x@summary</code> for which the predictive marginal densities are calculated. The default value is 1.
<code>variables</code>	a vector containing indices of variables in subvectors $\mathbf{x}$. The default value is <code>1:d</code> .
<code>...</code>	currently not used.

Methods

`signature(x = "REBMIX")` an object of class REBMIX.

`signature(x = "REBMVNORM")` an object of class REBMVNORM.

Description

Object of class EM.Control.

Objects from the Class

Objects can be created by calls of the form `new("EM.Control", ...)`. Accessor methods for the slots are `a.strategy(x = NULL)`, `a.variant(x = NULL)`, `a.acceleration(x = NULL)`, `a.tolerance(x = NULL)`, `a.acceleration.multiplier(x = NULL)`, `a.maximum.iterations(x = NULL)`, `a.K(x = NULL)` and `a.eliminate.zero.components(x = NULL)`, where `x` stands for an object of class EM.Control. Setter methods `a.strategy(x = NULL)`, `a.variant(x = NULL)`, `a.acceleration(x = NULL)`, `a.tolerance(x = NULL)`, `a.acceleration.multiplier(x = NULL)`, `a.maximum.iterations(x = NULL)`, `a.K(x = NULL)` and `eliminate.zero.components` are provided to write to strategy, variant, acceleration, tolerance, acceleration.multiplier, maximum.iterations and eliminate.zero.components slot respectively.

Slots

strategy: a character containing the EM and REBMIX strategy. One of "none", "exhaustive", "best" and "single". The default value is "none".

variant: a character containing the type of the EM algorithm to be used. One of "EM" or "ECM". The default value is "EM".

acceleration: a character containing the type of acceleration of the EM iteration increment. One of "fixed", "line" or "golden". The default value is "fixed".

tolerance: tolerance value for the EM convergence criteria. The default value is 1.0E-4.

acceleration.multiplier: `acceleration.multiplier  $a_{EM}$` , $1.0 \leq a_{EM} \leq 2.0$. `acceleration.multiplier` for the EM step increment. The default value is 1.0.

maximum.iterations: a positive integer containing the maximum allowed number of iterations of the EM algorithm. The default value is 1000.

K: an integer containing the number of bins for the histogram based EM algorithm. This option can reduce computational time drastically if the datasets contain a large number of observations n and K is set to the value $\ll n$. The default value of 0 means that the EM algorithm runs over all n .

eliminate.zero.components: a logical indicating if the componenets with $w_l = 0$ should be eliminated from output. Only used with EMMIX-methods.

EM
```

EMMIX-methods

EM Algorithm for Univariate or Multivariate Finite Mixture Estimation

Description

Returns as default the EM algorithm output for mixtures of conditionally independent normal, log-normal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac or von Mises component densities. If model equals "REBMVNORM" output for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices is returned.

Usage

```
## S4 method for signature 'REBMIX'
EMMIX(model = "REBMIX", Dataset = list(),
  Theta = NULL, EMcontrol = NULL, ...)
## ... and for other signatures
```

Arguments

model	see Methods section below.
Dataset	a list of length n_D of data frames of size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.
Theta	an object of class EMMIX.Theta or EMMVNORM.Theta.
EMcontrol	an object of class EM.Control.
...	currently not used.

Value

Returns an object of class REBMIX or REBMVNORM.

Methods

signature(model = "REBMIX") a character giving the default class name "REBMIX" for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac or von Mises component densities.

signature(model = "REBMVNORM") a character giving the class name "REBMVNORM" for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

EMMIX.Theta-class	Class "EMMIX.Theta"
-------------------	---------------------

Description

Object of class EMMIX.Theta.

Objects from the Class

Objects can be created by calls of the form `new("EMMIX.Theta", ...)`. Accessor methods for the slots are `a.c(x = NULL)`, `a.d(x = NULL)`, `a.pdf(x = NULL)` and `a.Theta(x = NULL)`, where `x` stands for an object of class EMMIX.Theta. Setter methods `a.theta1(x = NULL, l = numeric())`, `a.theta2(x = NULL, l = numeric())`, `a.theta3(x = NULL, l = numeric())`, `a.theta1.all(x = NULL)`, `a.theta2.all(x = NULL)`, `a.theta3.all(x = NULL)` and `a.w(x = NULL)` are provided to write to Theta slot, where $l = 1, \dots, c$.

Slots

c: number of components $c > 0$. The default value is 1.

d: number of dimensions.

pdf: a character vector of length d containing continuous or discrete parametric family types. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac" or "vonMises".

Theta: a list containing c parametric family types pdf1. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac" or circular "vonMises" defined for $0 \leq y_i \leq 2\pi$. Component parameters `theta1.l` follow the parametric family types. One of μ_{il} for normal, lognormal, Gumbel and von Mises distributions and θ_{il} for Weibull, gamma, binomial, Poisson and Dirac distributions. Component parameters `theta2.l` follow `theta1.l`. One of σ_{il} for normal, lognormal and Gumbel distributions, β_{il} for Weibull and gamma distributions, p_{il} for binomial distribution, κ_{il} for von Mises distribution. Component parameters `theta3.l` follow `theta2.l`. One of $\xi_{il} \in \{-1, 1\}$ for Gumbel distribution.

w: a vector of length c containing component weights w_l summing to 1.

```

Theta

Description

Returns an object of class Histogram. The method can be called recursively. This way more than one dataset can be binned into one histogram. Set shrink to TRUE only when the method is called for the last time to optimize the size of the object. The method is memory consuming.

Usage

```
## S4 method for signature 'Histogram'
fhistogram(x = NULL, Dataset = data.frame(),
           K = numeric(), ymin = numeric(), ymax = numeric(),
           shrink = FALSE, ...)
## ... and for other signatures
```

Arguments

x	an object of class Histogram.
Dataset	a data frame of size $n \times d$ containing d -dimensional dataset. Each of the d columns represents one random variable. Number of observations n equals the number of rows in the dataset.
K	an integer or a vector of length d containing numbers of bins v .
ymin	a vector of length d containing minimum observations.
ymax	a vector of length d containing maximum observations.
shrink	logical. If TRUE the output is shrunk to its optimal size. The default value is FALSE.
...	currently not used.

Methods

signature(x = "Histogram") an object of class Histogram.

Author(s)

Marko Nagode

Examples

```
# Create three datasets.

set.seed(1)

n <- 15
```

```

Dataset1 <- as.data.frame(cbind(rnorm(n, 157, 8), rnorm(n, 71, 10)))
Dataset2 <- as.data.frame(cbind(rnorm(n, 244, 14), rnorm(n, 61, 29)))
Dataset3 <- as.data.frame(cbind(rnorm(n, 198, 8), rnorm(n, 252, 13)))

apply(Dataset1, 2, range)
apply(Dataset2, 2, range)
apply(Dataset3, 2, range)

# Bin the first dataset.

hist <- fhistogram(Dataset = Dataset1, K = c(4, 5), ymin = c(100.0, 0.0), ymax = c(300.0, 300.0))

# Bin the second dataset.

hist <- fhistogram(x = hist, Dataset = Dataset2)

# Bin the third dataset and shrink the hist object.

hist <- fhistogram(x = hist, Dataset = Dataset3, shrink = TRUE)

hist

```

galaxy

Galaxy Dataset

Description

The unfilled survey of the Corona Borealis region contains the velocities of 82 galaxies from 6 well separated conic sections of space.

Usage

```
data(galaxy)
```

Format

galaxy is a data frame with 82 cases (rows) and 1 continuous variable (columns) called Velocity.

Histogram-class	Class "Histogram"
-----------------	-------------------

Description

Object of class Histogram.

Objects from the Class

Objects can be created by calls of the form `new("Histogram", ...)`. Accessor methods for the slots are `a.Y(x = NULL)`, `a.K(x = NULL)`, `a.ymin(x = NULL)`, `a.ymax(x = NULL)`, `a.y0(x = NULL)`, `a.h(x = NULL)`, `a.n(x = NULL)` and `a.ns(x = NULL)`.

Slots

Y: a data frame of size $v \times (d + 1)$ containing d -dimensional histogram. Each of the first d columns represents one random variable and contains bin means $\bar{y}_1, \dots, \bar{y}_v$. Column $d + 1$ contains frequencies $k_1, \dots, k_v$.

K: an integer or a vector of length d containing numbers of bins v .

ymin: a vector of length d containing minimum observations.

ymax: a vector of length d containing maximum observations.

y0: a vector of length d containing origins.

h: a vector of length d containing bin widths.

n: an integer containing total number n of observations.

ns: an integer containing number n_s of samples.

Author(s)

Marko Nagode

Examples

```
Y <- as.data.frame(matrix(1.0, nrow = 8, ncol = 3))
```

```
hist <- new("Histogram", Y = Y, K = c(4, 2), ymin = c(2, 1), ymax = c(10, 8))
```

```

a.K(hist)
a.ymin(hist)
a.ymax(hist)
a.y0(hist)
```

```

a.h(hist)
a.n(hist)
a.ns(hist)

# Multiplay Y[ , d + 1] by 0.1.

a.Y(hist) <- 0.1

```

HQC-methods

Hannan-Quinn Information Criterion

Description

Returns the Hannan-Quinn information criterion at pos.

Usage

```

## S4 method for signature 'REBMIX'
HQC(x = NULL, pos = 1, ...)
## ... and for other signatures

```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

Author(s)

Marko Nagode

References

ICL-methods

*Integrated Classification Likelihood Criterion***Description**

Returns the integrated classification likelihood criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
ICL(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
 signature(x = "REBMVNORM") an object of class REBMVNORM.

ICLBIC-methods

*Approximate Integrated Classification Likelihood Criterion***Description**

Returns the approximate integrated classification likelihood criterion at pos.

Usage

```
## S4 method for signature 'REBMIX'
ICLBIC(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>pos</code>	a desired row number in <code>x@summary</code> for which the information criterion is calculated. The default value is 1.
<code>...</code>	currently not used.

Methods

`signature(x = "REBMIX")` an object of class REBMIX.

`signature(x = "REBMVNORM")` an object of class REBMVNORM.

iris

Iris Data Set

Description

This is perhaps the best known database to be found in the pattern recognition literature. Fisher's paper is a classic in the field and is referenced frequently to this day. The data set contains 3 classes of 50 instances each, where each class refers to a type of iris plant. One class is linearly separable from the other 2; the latter are NOT linearly separable from each other.

Usage

```
data(iris)
```

Format

`iris` is a data frame with 150 cases (rows) and 5 variables (columns) named:

1. `Sepal.Length` continuous.
2. `Sepal.Width` continuous.
3. `Petal.Length` continuous.
4. `Petal.Width` continuous.
5. Class discrete `iris-setosa`, `iris-versicolour` or `iris-virginica`.

  x = list(irisest),
  Dataset = a.test(Iris),
  Zt = a.Zt(Iris))

iriscla

summary(iriscla)
```

```
# Plot selected chunks.

plot(iriscla, nrow = 3, ncol = 2)

## End(Not run)
```

kseq

Sequence of Bins or Nearest Neighbours Generation

Description

Returns (invisibly) a vector containing numbers of bins v for the histogram and the kernel density estimation or numbers of nearest neighbours k for the k -nearest neighbour.

Usage

```
kseq(from = NULL, to = NULL, f = 0.05, ...)
```

Arguments

from	starting value of the sequence. The default value is NULL.
to	end value of the sequence. The default value is NULL.
f	number specifying the fraction by which the bins or nearest neighbours should be separated $0.0 < f < 1.0$. The default value is 0.05.
...	currently not used.

Author(s)

Marko Nagode

Examples

```
# Generate numbers of bins.

n <- 10000

Sturges <- as.integer(1 + log2(n)) # Minimum v follows Sturges rule.
Log10 <- as.integer(10 * log10(n)) # Maximum v follows Log10 rule.
RootN <- as.integer(2 * n^0.5) # Maximum v follows RootN rule.

K <- kseq(from = Sturges, to = Log10, f = 0.05)

K

K <- kseq(from = Sturges, to = RootN, f = 0.03)

K
```

Description

Returns the list with the data frame M_{ij} containing the cluster levels l , the numbers of pixels n and the cluster moments $\mathbf{M} = (M_{10}, M_{01}, M_{11})^\top$ for 2D images or the data frame M_{ijk} containing the cluster levels l , the numbers of voxels n and the cluster moments $\mathbf{M} = (M_{100}, M_{010}, M_{001}, M_{111})^\top$ for 3D images and the adjacency matrix A of size $c_{\max} \times c_{\max}$. It may have some NA rows and columns. To calculate the adjacency matrix $A(i, j) = \exp(-\|\mathbf{M}_i - \mathbf{M}_j\|^2 / 2\sigma^2)$, the raw cluster moments are first converted into z-scores.

Usage

```
## S4 method for signature 'array'
labelmoments(Zp = array(), cmax = integer(), Sigma = 1.0, ...)
## ... and for other signatures
```

Arguments

<code>Zp</code>	a 2D array of size $width \times height$ or a 3D array of size $width \times height \times depth$ containing the predictive cluster membership Ω_l , where $l \in \{0, 1, \dots, c\}$. The cluster $l = 0$ may contain the pixels for 2D images or the voxels for 3D images, which are ignored by this method.
<code>cmax</code>	maximum number of clusters $c_{\max} \geq c$.
<code>Sigma</code>	scale parameter σ for the Gaussian kernel function $\exp(-\ \mathbf{M}_i - \mathbf{M}_j\ ^2 / 2\sigma^2)$. The default value is <code>1.0</code> .
<code>...</code>	currently not used.

Methods

`signature(Zp = "array")` an array.

logL

*Log Likelihood***Description**

Returns the log likelihood at pos.

Usage

```

## S4 method for signature 'REBMIX'
logL(x = NULL, pos = 1, ...)
## ... and for other signatures

```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

```

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

```

mapclusters-methods *Map Clusters*

Description

Returns a factor of predictive cluster membership for dataset.

Usage

```
## S4 method for signature 'RCLRMIX'
mapclusters(x = NULL, Dataset = data.frame(),
            s = expression(c), ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>Dataset</code>	a data frame of size $n \times d$ containing d -dimensional dataset. Each of the d columns represents one random variable. Number of observations n equal the number of rows in the dataset.
<code>s</code>	a desired number of clusters to be created. The default value is <code>expression(c)</code> .
<code>...</code>	currently not used.

Methods

`signature(x = "RCLRMIX")` an object of class RCLRMIX.
`signature(x = "RCLRMVNORM")` an object of class RCLRMVNORM.

MDL-methods

*Minimum Description Length***Description**

Returns the minimum description length at pos.

Usage

```
## S4 method for signature 'REBMIX'
MDL2(x = NULL, pos = 1, ...)
## S4 method for signature 'REBMIX'
MDL5(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
 signature(x = "REBMVNORM") an object of class REBMVNORM.

Marko Nagode

References

M. H. Hansen and B. Yu. Model selection and the principle of minimum description length. Journal of the American Statistical Association, 96(454):746-774, 2001. <https://www.jstor.org/stable/2670311>.

Description

Returns the list with the normalised adjacency matrix L of size $c \times c$. The normalised adjacency matrix $L = D^{-1/2} P D^{-1/2}$ depends on the probability adjacency matrix $P(i, j) = \sum_{l=1}^n p_l A_l(i, j)$, where $p_l = w_l / \sum_{i=1}^c \sum_{j=i+1}^c A_l(i, j)$ and the degree matrix $D(i, i) = \sum_{j=1}^c P(i, j)$. The A_l matrices may contain some NA rows and columns, which are eliminated by the method. The list also contains the vector of integers `cluster` of length k , which indicates the cluster to which each label is assigned.

Usage

```
## S4 method for signature 'list'
mergelabels(A = list(), w = numeric(), k = 2, ...)
## ... and for other signatures
```

Arguments

<code>A</code>	a list of length n of adjacency matrices A_l of size $c_{\max} \times c_{\max}$, where $c_{\max} \geq c$.
<code>w</code>	vector of length n containing weights w_l summing to 1.
<code>k</code>	number of clusters k for kmeans . The default value is 2.
<code>...</code>	further arguments to kmeans .

Methods

`signature(A = "list")` a list.

optbins-methods

*Optimal Numbers of Bins Calculation***Description**

Returns the matrix of size $n_D \times d$ containing optimal numbers of bins $v_1, \dots, v_d$ for all processed datasets.

Usage

```

## S4 method for signature 'list'
optbins(Dataset = list(), Rule = "Knuth equal",
        ymin = numeric(), ymax = numeric(), kmin = numeric(),
        kmax = numeric(), ...)
## ... and for other signatures

```

Arguments

Dataset	a list of length n_D of data frames of size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.
Rule	a character giving the histogram binning rule. One of "Sturges", "Log10", "RootN", default "Knuth equal" or "Knuth unequal".
ymin	a vector of length d containing minimum observations. The default value is numeric().
ymax	a vector of length d containing maximum observations. The default value is numeric().
kmin	lower limit of the number of bins. The default value is numeric().
kmax	upper limit of the number of bins. The default value is numeric().
...	currently not used.

Methods

signature(x = "list") a list of data frames.

pemix-methods

Empirical Distribution Function Calculation

Description

Returns the data frame containing observations $\mathbf{x}_1, \dots, \mathbf{x}_n$ and empirical distribution functions $F_1, \dots, F_n$. Vectors $\mathbf{x}$ are subvectors of $\mathbf{y} = (y_1, \dots, y_d)^\top$.

Usage

```
## S4 method for signature 'REBMIX'
pemix(x = NULL, pos = 1, variables = expression(1:d),
      lower.tail = TRUE, log.p = FALSE, ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>pos</code>	a desired row number in <code>x@summary</code> for which the empirical distribution functions are calculated. The default value is 1.
<code>variables</code>	a vector containing indices of variables in subvectors $\mathbf{x}$. The default value is <code>1:d</code> .
<code>lower.tail</code>	logical. If TRUE, probabilities are $P[X \leq x]$, otherwise, $P[X > x]$. The default value is TRUE.
<code>log.p</code>	logical. if TRUE, probabilities p are given as $\log(p)$. The default value is FALSE.
<code>...</code>	currently not used.

Methods

`signature(x = "REBMIX")` an object of class REBMIX.

`signature(x = "REBMVNORM")` an object of class REBMVNORM.

pfmix-methods

Predictive Marginal Distribution Function Calculation

Description

Returns the data frame containing observations $x_1, \dots, x_n$ and predictive marginal distribution functions $F(x|c, w, \Theta)$. Vectors x are subvectors of $y = (y_1, \dots, y_d)^\top$. If $x = y$ the method returns the data frame containing observations $y_1, \dots, y_n$ and the corresponding predictive mixture distribution function $F(y|c, w, \Theta)$.

Usage

```
## S4 method for signature 'REBMIX'
pfmix(x = NULL, Dataset = data.frame(), pos = 1,
      variables = expression(1:d), lower.tail = TRUE, log.p = FALSE, ...)
## ... and for other signatures
```

Arguments

<code>x</code>	see Methods section below.
<code>Dataset</code>	a data frame containing observations $y = (y_1, \dots, y_d)^\top$ for which the predictive marginal distribution functions are calculated. The default value is <code>data.frame()</code> .
<code>pos</code>	a desired row number in <code>x@summary</code> for which the predictive marginal distribution functions are calculated. The default value is 1.
<code>variables</code>	a vector containing indices of variables in subvectors x . The default value is <code>1:d</code> .
<code>lower.tail</code>	logical. If TRUE, probabilities are $P[X \leq x]$, otherwise, $P[X > x]$. The default value is TRUE.
<code>log.p</code>	logical. if TRUE, probabilities p are given as $\log(p)$. The default value is FALSE.
<code>...</code>	currently not used.

Methods

```
signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

plot-methods

Plots *RNGMIX*, *REBMIX*, *RCLRMIX* and *RCLSMIX* Output

Description

Plots true clusters if `x` equals "RNGMIX". Plots the REBMIX output depending on `what` argument if `x` equals "REBMIX". Plots predictive clusters if `x` equals "RCLRMIX". Wrongly clustered observations are plotted only if `x@Zt` is available. Plots predictive classes and wrongly classified observations if `x` equals "RCLSMIX".

Usage

```

## S4 method for signature 'RNGMIX,missing'
plot(x, y, pos = 1, nrow = 1, ncol = 1, cex = 0.8,
  fg = "black", lty = "solid", lwd = 1, pty = "m", tcl = 0.5,
  plot.cex = 0.8, plot.pch = 19, ...)
## S4 method for signature 'REBMIX,missing'
plot(x, y, pos = 1, what = c("pdf"),
  nrow = 1, ncol = 1, npts = 200, n = 200, cex = 0.8, fg = "black",
  lty = "solid", lwd = 1, pty = "m", tcl = 0.5,
  plot.cex = 0.8, plot.pch = 19, contour.drawlabels = FALSE,
  contour.labcex = 0.8, contour.method = "flatteest",
  contour.nlevels = 12, log = "", ...)
## S4 method for signature 'RCLRMIX,missing'
plot(x, y, s = expression(c), nrow = 1, ncol = 1, cex = 0.8,
  fg = "black", lty = "solid", lwd = 1, pty = "m", tcl = 0.5,
  plot.cex = 0.8, plot.pch = 19, ...)
## S4 method for signature 'RCLSMIX,missing'
plot(x, y, nrow = 1, ncol = 1, cex = 0.8,
  fg = "black", lty = "solid", lwd = 1, pty = "m", tcl = 0.5,
  plot.cex = 0.8, plot.pch = 19, ...)
## ... and for other signatures

```

Arguments

<code>x</code>	see Methods section below.
<code>y</code>	currently not used.

<code>pos</code>	a desired row number in <code>x@summary</code> to be plotted. The default value is 1.
<code>s</code>	a desired number of clusters to be plotted. The default value is <code>expression(c)</code> .
<code>what</code>	a character vector giving the plot types. One of "pdf" for probability density function, "marginal pdf" for marginal probability density function, "IC" for information criterion depending on numbers of components c , "logL" for log likelihood, "D" for total of positive relative deviations, "K" for information criterion depending on bins v or numbers of nearest neighbours k , "cdf" for univariate distribution function or "marginal cdf" for marginal distribution function. The default value is "pdf".
<code>nrow</code>	a desired number of rows in which the empirical and predictive densities are to be plotted. The default value is 1.
<code>ncol</code>	a desired number of columns in which the empirical and predictive densities are to be plotted. The default value is 1.
<code>npts</code>	a number of points at which the predictive densities are to be plotted. The default value is 200.
<code>n</code>	a number of observations to be plotted. The default value is 200.
<code>cex</code>	a numerical value giving the amount by which the plotting text and symbols should be magnified relative to the default, see also <code>par</code> . The default value is 0.8.
<code>fg</code>	a colour used for things like axes and boxes around plots, see also <code>par</code> . The default value is "black".
<code>lty</code>	a line type, see also <code>par</code> . The default value is "solid".
<code>lwd</code>	a line width, see also <code>par</code> . The default value is 1.
<code>pty</code>	a character specifying the type of the plot region to be used. One of "s" generating a square plotting region or "m" generating the maximal plotting region. The default value is "m".
<code>tcl</code>	a length of tick marks as a fraction of the height of a line of the text, see also <code>par</code> . The default value is 0.5.
<code>plot.cex</code>	a numerical vector giving the amount by which plotting characters and symbols should be scaled relative to the default. It works as a multiple of <code>par("cex")</code> . NULL and NA are equivalent to 1.0. Note that this does not affect annotation, see also <code>plot.default</code> . The default value is 0.8.
<code>plot.pch</code>	a vector of plotting characters or symbols, see also <code>points</code> . The default value is 19.
<code>contour.drawlabels</code>	logical. The contours are labelled if TRUE. The default value is FALSE.
<code>contour.labcex</code>	cex for contour labelling. The default value is 0.8. This is an absolute size, not a multiple of <code>par("cex")</code> .
<code>contour.method</code>	a character specifying where the labels will be located. The possible values are "simple", "edge" and default "flattest", see also <code>contour</code> .
<code>contour.nlevels</code>	a number of desired contour levels. The default value is 12.

`log` a character which contains "x" if the x axis is to be logarithmic, "y" if the y axis is to be logarithmic and "xy" or "yx" if both axes are to be logarithmic. The default value is "".

`...` further arguments to `par`.

Value

Returns (invisibly) a list containing graphical parameters `par`. Such a list can be passed as an argument to `par` to restore the parameter values.

Methods

`signature(x = "RNGMIX", y = "missing")` an object of class `RNGMIX`.
`signature(x = "RNGMVNORM", y = "missing")` an object of class `RNGMVNORM`.
`signature(x = "REBMIX", y = "missing")` an object of class `REBMIX`.
`signature(x = "REBMVNORM", y = "missing")` an object of class `REBMVNORM`.
`signature(x = "RCLRMIX", y = "missing")` an object of class `RCLRMIX`.
`signature(x = "RCLRMVNORM", y = "missing")` an object of class `RCLRMVNORM`.
`signature(x = "RCLSMIX", y = "missing")` an object of class `RCLSMIX`.
`signature(x = "RCLSMVNORM", y = "missing")` an object of class `RCLSMVNORM`.

PRD-methods

Total of Positive Relative Deviations

Description

Returns the total of positive relative deviations D at pos.

Usage

```

## S4 method for signature 'REBMIX'
PRD(x = NULL, pos = 1, ...)
## ... and for other signatures

```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.

signature(x = "REBMVNORM") an object of class REBMVNORM.

RCLRMIX-class

Class "RCLRMIX"

Description

Object of class RCLRMIX.

Objects from the Class

Objects can be created by calls of the form `new("RCLRMIX", ...)`. Accessor methods for the slots are `a.Dataset(x = NULL)`, `a.pos(x = NULL)`, `a.Zt(x = NULL)`, `a.Zp(x = NULL, s = expression(c))`, `a.c(x = NULL)`, `a.p(x = NULL, s = expression(c))`, `a.pi(x = NULL, s = expression(c))`, `a.P(x = NULL, s = expression(c))`, `a.tau(x = NULL, s = expression(c))`, `a.prob(x = NULL)`, `a.Rule(x = NULL)`, `a.from(x = NULL)`, `a.to(x = NULL)`, `a.EN(x = NULL)` and `a.ED(x = NULL)`, where `x` stands for an object of class RCLRMIX and `s` a desired number of clusters for which the slot is calculated.

Slots

- x:** an object of class REBMIX.
- Dataset:** a data frame or an object of class Histogram to be clustered.
- pos:** a desired row number in `x@summary` for which the clustering is performed. The default value is 1.
- Zt:** a factor of true cluster membership.
- Zp:** a factor of predictive cluster membership.
- c:** number of nonempty clusters.
- p:** a vector of length c containing prior probabilities of cluster memberships p_l summing to 1. The value is returned only if all variables in slot `x` follow either binomial or Dirac parametric families. The default value is `numeric()`.
- pi:** a list of length d of matrices of size $c \times K_i$ containing cluster conditional probabilities π_{ilk} . Let π_{ilk} denote the cluster conditional probability that an observation in cluster $l = 1, \dots, c$ produces the k th outcome on the i th variable. Suppose we observe $i = 1, \dots, d$ polytomous categorical variables (the manifest variables), each of which contains K_i possible outcomes for observations $j = 1, \dots, n$. A manifest variable is a variable that can be measured or

observed directly. It must be coded as whole number starting at zero for the first outcome and increasing to the possible number of outcomes minus one. It is presumed here that all variables are statistically independent and within clusters and that $\mathbf{y}_1, \dots, \mathbf{y}_n$ stands for an observed d dimensional dataset of size n of vector observations $\mathbf{y}_j = (y_{1j}, \dots, y_{ij}, \dots, y_{dj})^\top$. The value is returned only if all variables in slot x follow either binomial or Dirac parametric families. The default value is `list()`.

P: a data frame containing true $N_t(\mathbf{y}_{\tilde{j}})$ and predictive $N_p(\mathbf{y}_{\tilde{j}})$ frequencies calculated for unique $\mathbf{y}_{\tilde{j}} \in \{\mathbf{y}_1, \dots, \mathbf{y}_n\}$, where $\tilde{j} = 1, \dots, \tilde{n}$ and $\tilde{n} \leq n$.

tau: a matrix of size $n \times c$ containing conditional probabilities τ_{jl} that observations $\mathbf{y}_1, \dots, \mathbf{y}_n$ arise from clusters $1, \dots, c$.

prob: a vector of length c containing probabilities of correct clustering for $s = 1, \dots, c$.

Rule: a character containing the merging rule. One of "Entropy" and "Demp". The default value is "Entropy".

from: a vector of length $c - 1$ containing clusters merged to to clusters.

to: a vector of length $c - 1$ containing clusters originating from from clusters.

EN: a vector of length $c - 1$ containing entropies for combined clusters.

ED: a vector of length $c - 1$ containing decrease of entropies for combined clusters.

A: an adjacency matrix of size $c_{\max} \times c_{\max}$, where $c_{\max} \geq c$.

RCLRMIX-methods

*Predicts Cluster Membership Based Upon a Model Trained by REB-
MIX*

Description

Returns as default the RCLRMIX algorithm output for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities, following the methodology proposed in the article cited in the references. If model equals "RCLRMVNORM" output for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices is returned.

Usage

```

## S4 method for signature 'RCLRMIX'
RCLRMIX(model = "RCLRMIX", x = NULL, Dataset = NULL,
  pos = 1, Zt = factor(), Rule = character(), ...)
## ... and for other signatures
## S4 method for signature 'RCLRMIX'
summary(object, ...)
## ... and for other signatures

```

Arguments

<code>model</code>	see Methods section below.
<code>x</code>	an object of class REBMIX.
<code>Dataset</code>	a data frame or an object of class Histogram to be clustered.
<code>pos</code>	a desired row number in <code>x@summary</code> for which the clustering is performed. The default value is 1.
<code>Zt</code>	a factor of true cluster membership. The default value is <code>factor()</code> .
<code>Rule</code>	a character containing the merging rule. One of "Entropy" or "Demp". The default value is "Entropy".
<code>object</code>	see Methods section below.
<code>...</code>	currently not used.

Value

Returns an object of class RCLRMIX or RCLRMVNORM.

Methods

`signature(model = "RCLRMIX")` a character giving the default class name "RCLRMIX" for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities.

`signature(model = "RCLRMVNORM")` a character giving the class name "RCLRMVNORM" for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

`signature(object = "RCLRMIX")` an object of class RCLRMIX.

`signature(object = "RCLRMVNORM")` an object of class RCLRMVNORM.

RCLS.chunk-class

Class "RCLS.chunk"

Description

Object of class RCLS.chunk.

Objects from the Class

Objects can be created by calls of the form `new("RCLS.chunk", ...)`. Accessor methods for the slots are `a.s(x = NULL)`, `a.levels(x = NULL)`, `a.ntrain(x = NULL)`, `a.train(x = NULL)`, `a.Zr(x = NULL)`, `a.ntest(x = NULL)`, `a.test(x = NULL)` and `a.Zt(x = NULL)`, where `x` stands for an object of class `RCLS.chunk`.

Slots

s: finite set of size s of classes $\Omega = \{\Omega_g; g = 1, \dots, s\}$.
levels: a character vector of length s containing class names Ω_g .
ntrain: a vector of length s containing numbers of observations in train datasets $Y_{\text{train}g}$.
train: a list of length n_D of data frames containing train datasets $Y_{\text{train}g}$ of length $n_{\text{train}g}$.
Zr: a list of factors of true class membership Ω_g for the train datasets.
ntest: number of observations in test dataset Y_{test} .
test: a data frame containing test dataset Y_{test} of length n_{test} .
Zt: a factor of true class membership Ω_g for the test dataset.

RCLSMIX-class

Class "RCLSMIX"

Description

Object of class RCLSMIX.

Objects from the Class

Objects can be created by calls of the form `new("RCLSMIX", ...)`. Accessor methods for the slots are `a.o(x = NULL)`, `a.Dataset(x = NULL)`, `a.s(x = NULL)`, `a.ntrain(x = NULL)`, `a.P(x = NULL)`, `a.ntest(x = NULL)`, `a.Zt(x = NULL)`, `a.Zp(x = NULL)`, `a.CM(x = NULL)`, `a.Accuracy(x = NULL)`, `a.Error(x = NULL)`, `a.Precision(x = NULL)`, `a.Sensitivity(x = NULL)`, `a.Specificity(x = NULL)` and `a.Chunks(x = NULL)`, where `x` stands for an object of class `RCLSMIX`.

Slots

x: a list of objects of class REBMIX of length o obtained by running REBMIX on $g = 1, \dots, s$ train datasets $Y_{\text{train}g}$ all of length $n_{\text{train}g}$. For the train datasets the corresponding class membership Ω_g is known. This yields $n_{\text{train}} = \sum_{g=1}^s n_{\text{train}g}$, while $Y_{\text{train}q} \cap Y_{\text{train}g} = \emptyset$ for all $q \neq g$. Each object in the list corresponds to one chunk, e.g., $(y_{1j}, y_{3j})^\top$.

o: number of chunks o . $Y = \{\mathbf{y}_j; j = 1, \dots, n\}$ is an observed d -dimensional dataset of size n of vector observations $\mathbf{y}_j = (y_{1j}, \dots, y_{dj})^\top$ and is partitioned into train and test datasets. Vector observations $\mathbf{y}_j$ may further be split into o chunks when running REBMIX, e.g., for $d = 6$ and $o = 3$ the set of chunks substituting $\mathbf{y}_j$ may be as follows $(y_{1j}, y_{3j})^\top, (y_{2j}, y_{4j}, y_{6j})^\top$ and y_{5j} .

Dataset: a data frame containing test dataset Y_{test} of length n_{test} . For the test dataset the corresponding class membership Ω_g is not known.

s: finite set of size s of classes $\Omega = \{\Omega_g; g = 1, \dots, s\}$.

ntrain: a vector of length s containing numbers of observations in train datasets $Y_{\text{train}g}$.

P: a vector of length s containing prior probabilities $P(\Omega_g) = \frac{n_{\text{train}g}}{n_{\text{train}}}$.

ntest: number of observations in test dataset Y_{test} .

Zt: a factor of true class membership Ω_g for the test dataset.

Zp: a factor of predictive class membership Ω_g for the test dataset.

CM: a table containing confusion matrix for multiclass classifier. It contains number x_{qg} of test observations with the true class q that are classified into the class g , where $q, g = 1, \dots, s$.

Accuracy: proportion of all test observations that are classified correctly. $\text{Accuracy} = \frac{\sum_{g=1}^s x_{gg}}{n_{\text{test}}}$.

Error: proportion of all test observations that are classified wrongly. $\text{Error} = 1 - \text{Accuracy}$.

Precision: a vector containing proportions of predictive observations in class g that are classified correctly into class g . $\text{Precision}(g) = \frac{x_{gg}}{\sum_{q=1}^s x_{qg}}$.

Sensitivity: a vector containing proportions of test observations in class g that are classified correctly into class g . $\text{Sensitivity}(g) = \frac{x_{gg}}{\sum_{q=1}^s x_{gq}}$.

Specificity: a vector containing proportions of test observations that are not in class g and are classified into the non g class. $\text{Specificity}(g) = \frac{n_{\text{test}} - \sum_{q=1}^s x_{qg}}{n_{\text{test}} - \sum_{q=1}^s x_{gq}}$.

Chunks: a vector containing selected chunks.

REBMIX-class

Class "REBMIX"

Description

Object of class REBMIX.

Objects from the Class

Objects can be created by calls of the form `new("REBMIX", ...)`. Accessor methods for the slots are `a.Dataset(x = NULL, pos = 0)`, `a.Preprocessing(x = NULL)`, `a.cmax(x = NULL)`, `a.cmin(x = NULL)`, `a.Criterion(x = NULL)`, `a.Variables(x = NULL)`, `a.pdf(x = NULL)`, `a.theta1(x = NULL)`, `a.theta2(x = NULL)`, `a.theta3(x = NULL)`, `a.K(x = NULL)`, `a.ymin(x = NULL)`, `a.ymax(x = NULL)`, `a.ar(x = NULL)`, `a.Restrainsts(x = NULL)`, `a.Mode(x = NULL)`, `a.w(x = NULL, pos = 0)`, `a.Theta(x = NULL, pos = 0)`, `a.summary(x = NULL, col.name = character(), pos = 0)`, `a.summary.EM(x = NULL, col.name = character(), pos = 0)`, `a.pos(x = NULL)`, `a.opt.c(x = NULL)`, `a.opt.IC(x = NULL)`, `a.opt.logL(x = NULL)`, `a.opt.Dmin(x = NULL)`, `a.opt.D(x = NULL)`, `a.all.K(x = NULL)`, `a.all.IC(x = NULL)`, `a.theta1.all(x = NULL, pos = 1)`, `a.theta2.all(x = NULL, pos = 1)` and `a.theta3.all(x = NULL, pos = 1)`, where `x`, `pos` and `col.name` stand for an object of class REBMIX, a desired slot item and a desired column name, respectively.

Slots

Dataset: a list of length n_D of data frames or objects of class `Histogram`. Data frames should have size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.

Preprocessing: a character vector giving the preprocessing types. One of "histogram", "kernel density estimation" or "k-nearest neighbour".

- cmax:** maximum number of components $c_{\max} > 0$. The default value is 15.
- cmin:** minimum number of components $c_{\min} > 0$. The default value is 1.
- Criterion:** a character giving the information criterion type. One of default Akaike "AIC", "AIC3", "AIC4" or "AICc", Bayesian "BIC", consistent Akaike "CAIC", Hannan-Quinn "HQC", minimum description length "MDL2" or "MDL5", approximate weight of evidence "AWE", classification likelihood "CLC", integrated classification likelihood "ICL" or "ICL-BIC", partition coefficient "PC", total of positive relative deviations "D" or sum of squares error "SSE".
- Variables:** a character vector of length d containing types of variables. One of "continuous" or "discrete".
- pdf:** a character vector of length d containing continuous or discrete parametric family types. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or "vonMises".
- theta1:** a vector of length d containing initial component parameters. One of n_{il} = number of categories – 1 for "binomial" distribution.
- theta2:** a vector of length d containing initial component parameters. Currently not used.
- theta3:** a vector of length d containing initial component parameters. One of $\xi_{il} \in \{-1, \text{NA}, 1\}$ for "Gumbel" distribution.
- K:** a character or a vector or a list of vectors containing numbers of bins v for the histogram and the kernel density estimation or numbers of nearest neighbours k for the k -nearest neighbour. There is no genuine rule to identify v or k . Consequently, the REBMIX algorithm identifies them from the set K of input values by minimizing the information criterion. The Sturges rule $v = 1 + \log_2(n)$, Log₁₀ rule $v = 10\log_{10}(n)$ or RootN rule $v = 2\sqrt{n}$ can be applied to estimate the limiting numbers of bins or the rule of thumb $k = \sqrt{n}$ to guess the intermediate number of nearest neighbours. If, e.g., K = c(10, 20, 40, 60) and minimum IC coincides, e.g., 40, brackets are set to 20 and 60 and the golden section is applied to refine the minimum search. See also [kseq](#) for sequence of bins or nearest neighbours generation. The default value is "auto".
- ymin:** a vector of length d containing minimum observations. The default value is numeric().
- ymax:** a vector of length d containing maximum observations. The default value is numeric().
- ar:** acceleration rate $0 < a_r \leq 1$. The default value is 0.1 and in most cases does not have to be altered.
- Restraints:** a character giving the restraints type. One of "rigid" or default "loose". The rigid restraints are obsolete and applicable for well separated components only.
- Mode:** a character giving the mode type. One of "all", "outliers" or default "outliersplus". The modes are determined in decreasing order of magnitude from all observations if Mode = "all". If Mode = "outliers", the modes are determined in decreasing order of magnitude from outliers only. In the meantime, some outliers are reclassified as inliers. Finally, when all observations are inliers, the procedure is completed. If Mode = "outliersplus", the modes are determined in decreasing magnitude from the outliers only. In the meantime, some outliers are reclassified as inliers. Finally, if all observations are inliers, they are converted to outliers and the mode determination procedure is continued.
- w:** a list of vectors of length c containing component weights w_l summing to 1.
- Theta:** a list of lists each containing c parametric family types pdf1. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or circular

"vonMises" defined for $0 \leq y_i \leq 2\pi$. Component parameters `theta1.1` follow the parametric family types. One of μ_{il} for normal, lognormal, Gumbel and von Mises distributions, θ_{il} for Weibull, gamma, binomial, Poisson and Dirac distributions and a for uniform distribution. Component parameters `theta2.1` follow `theta1.1`. One of σ_{il} for normal, lognormal and Gumbel distributions, β_{il} for Weibull and gamma distributions, p_{il} for binomial distribution, κ_{il} for von Mises distribution and b for uniform distribution. Component parameters `theta3.1` follow `theta2.1`. One of ξ_{il} for Gumbel distribution.

summary: a data frame with additional information about dataset, preprocessing, $c_{\max}$, $c_{\min}$, information criterion type, a_r , restraints type, mode type, optimal c , optimal v or k , K , y_{i0} , $y_{i\min}$, $y_{i\max}$, optimal h_i , information criterion IC, log likelihood $\log L$ and degrees of freedom M .

summary.EM: a data frame with additional information about dataset, strategy for the EM algorithm strategy, variant of the EM algorithm variant, acceleration type acceleration, tolerance tolerance, acceleration multiplier acceleration.multiplier, maximum allowed number of iterations maximum.iterations, number of iterations used for obtaining optimal solution opt.iterations.nbr and total number of iterations of the EM algorithm total.iterations.nbr.

pos: position in the summary data frame at which log likelihood $\log L$ attains its maximum.

opt.c: a list of vectors containing numbers of components for optimal v for the histogram and the kernel density estimation or for optimal number of nearest neighbours k for the k -nearest neighbour.

opt.IC: a list of vectors containing information criteria for optimal v for the histogram and the kernel density estimation or for optimal number of nearest neighbours k for the k -nearest neighbour.

opt.logL: a list of vectors containing log likelihoods for optimal v for the histogram and the kernel density estimation or for optimal number of nearest neighbours k for the k -nearest neighbour.

opt.Dmin: a list of vectors containing $D_{\min}$ values for optimal v for the histogram and the kernel density estimation or for optimal number of nearest neighbours k for the k -nearest neighbour.

opt.D: a list of vectors containing totals of positive relative deviations for optimal v for the histogram and the kernel density estimation or for optimal number of nearest neighbours k for the k -nearest neighbour.

all.K: a list of vectors containing all processed numbers of bins v for the histogram and the kernel density estimation or all processed numbers of nearest neighbours k for the k -nearest neighbour.

all.IC: a list of vectors containing information criteria for all processed numbers of bins v for the histogram and the kernel density estimation or for all processed numbers of nearest neighbours k for the k -nearest neighbour.

REBMIX-methods	<i>REBMIX Algorithm for Univariate or Multivariate Finite Mixture Estimation</i>
----------------	--

Description

Returns as default the REBMIX algorithm output for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities. If model equals "REBMVNORM" output for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices is returned.

Usage

```
## S4 method for signature 'REBMIX'
REBMIX(model = "REBMIX", Dataset = list(), Preprocessing = character(),
        cmax = 15, cmin = 1, Criterion = "AIC", pdf = character(),
        theta1 = numeric(), theta2 = numeric(), theta3 = numeric(), K = "auto",
        ymin = numeric(), ymax = numeric(), ar = 0.1,
        Restraints = "loose", Mode = "outliersplus", EMcontrol = NULL, ...)
## ... and for other signatures
## S4 method for signature 'REBMIX'
summary(object, ...)
## ... and for other signatures
```

Arguments

model	see Methods section below.
Dataset	a list of length n_D of data frames or objects of class Histogram. Data frames should have size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.
Preprocessing	a character giving the preprocessing type. One of "histogram", "kernel density estimation" or "k-nearest neighbour".
cmax	maximum number of components $c_{\max} > 0$. The default value is 15.
cmin	minimum number of components $c_{\min} > 0$. The default value is 1. If $c_{\min} > 1$, it may happen that no solution is found, and an error is returned by the method.
Criterion	a character giving the information criterion type. One of default Akaike "AIC", "AIC3", "AIC4" or "AICc", Bayesian "BIC", consistent Akaike "CAIC", Hannan-Quinn "HQC", minimum description length "MDL2" or "MDL5", approximate weight of evidence "AWE", classification likelihood "CLC", integrated classification likelihood "ICL" or "ICL-BIC", partition coefficient "PC", total of positive relative deviations "D" or sum of squares error "SSE".
pdf	a character vector of length d containing continuous or discrete parametric family types. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or "vonMises".

theta1	a vector of length d containing initial component parameters. One of n_{il} = number of categories $- 1$ for "binomial" distribution.
theta2	a vector of length d containing initial component parameters. Currently not used.
theta3	a vector of length d containing initial component parameters. One of $\xi_{il} \in \{-1, NA, 1\}$ for "Gumbel" distribution.
K	a character or a vector or a matrix of size $n_D \times d$ containing numbers of bins v or $v_1, \dots, v_d$ for the histogram and the kernel density estimation or numbers of nearest neighbours k for the k -nearest neighbour. There is no genuine rule to identify v or k . Consequently, the REBMIX algorithm identifies them from the set K of input values by minimizing the information criterion. The Sturges rule $v = 1 + \log_2(n)$, Log ₁₀ rule $v = 10\log_{10}(n)$ or RootN rule $v = 2\sqrt{n}$ can be applied to estimate the limiting numbers of bins or the rule of thumb $k = \sqrt{n}$ to guess the intermediate number of nearest neighbours. If, e.g., $K = c(10, 20, 40, 60)$ and minimum IC coincides, e.g., 40, brackets are set to 20 and 60 and the golden section is applied to refine the minimum search. If, e.g., $K = \text{matrix}(c(10, 15, 18, 5, 7, 9), \text{byrow} = \text{TRUE}, \text{ncol} = 3)$ than $d = 3$ and the list Dataset contains $n_D = 2$ frames. Hence, different numbers of bins can be assigned to $y_1, \dots, y_d$. See also kseq for sequence of bins or nearest neighbours generation. The default value is "auto".
ymin	a vector of length d containing minimum observations. The default value is <code>numeric()</code> .
ymax	a vector of length d containing maximum observations. The default value is <code>numeric()</code> .
ar	acceleration rate $0 < a_r \leq 1$. The default value is 0.1 and in most cases does not have to be altered.
Restraints	a character giving the restraints type. One of "rigid" or default "loose". The rigid restraints are obsolete and applicable for well separated components only.
Mode	a character giving the mode type. One of "all", "outliers" or default "outliersplus". The modes are determined in decreasing order of magnitude from all observations if Mode = "all". If Mode = "outliers", the modes are determined in decreasing order of magnitude from outliers only. In the meantime, some outliers are reclassified as inliers. Finally, when all observations are inliers, the procedure is completed. If Mode = "outliersplus", the modes are determined in decreasing magnitude from the outliers only. In the meantime, some outliers are reclassified as inliers. Finally, if all observations are inliers, they are converted to outliers and the mode determination procedure is continued.
EMcontrol	an object of class EM.Control.
object	see Methods section below.
...	currently not used.

Value

Returns an object of class REBMIX or REBMVNORM.

Methods

`signature(model = "REBMIX")` a character giving the default class name "REBMIX" for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities.

`signature(model = "REBMVNORM")` a character giving the class name "REBMVNORM" for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

`signature(object = "REBMIX")` an object of class REBMIX.

`signature(object = "REBMVNORM")` an object of class REBMVNORM.

REBMIX.boot-class	Class "REBMIX.boot"
-------------------	---------------------

Description

Object of class REBMIX.boot.

Objects from the Class

Objects can be created by calls of the form `new("REBMIX.boot", ...)`. Accessor methods for the slots are `a.rseed(x = NULL)`, `a.pos(x = NULL)`, `a.Bootstrap(x = NULL)`, `a.B(x = NULL)`, `a.n(x = NULL)`, `a.replace(x = NULL)`, `a.prob(x = NULL)`, `a.c(x = NULL)`, `a.c.se(x = NULL)`, `a.c.cv(x = NULL)`, `a.c.mode(x = NULL)`, `a.c.prob(x = NULL)`, `a.w(x = NULL)`, `a.w.se(x = NULL)`, `a.w.cv(x = NULL)`, `a.Theta(x = NULL)`, `a.Theta.se(x = NULL)` and `a.Theta.cv(x = NULL)`, where `x` stands for an object of class REBMIX.boot.

Slots

x: an object of class REBMIX.

rseed: set the random seed to any negative integer value to initialize the sequence. The first bootstrap dataset corresponds to it. For each next bootstrap dataset the random seed is decremented $r_{\text{seed}} = r_{\text{seed}} - 1$. The default value is -1.

pos: a desired row number in `x@summary` to be bootstrapped. The default value is 1.

Bootstrap: a character giving the bootstrap type. One of default "parametric" or "nonparametric".

B: number of bootstrap datasets. The default value is 100.

n: number of observations. The default value is `numeric()`.

replace: logical. The sampling is with replacement if TRUE, see also [sample](#). The default value is TRUE.

prob: a vector of length n containing probability weights, see also [sample](#). The default value is `numeric()`.

c: a vector containing numbers of components for B bootstrap datasets.

c.se: standard error of numbers of components c .

c.cv: coefficient of variation of numbers of components c .

c.mode: mode of numbers of components c .

c.prob: probability of mode $c.mode$.

w: a matrix containing component weights for $\leq B$ bootstrap datasets.

w.se: a vector containing standard errors of component weights w .

w.cv: a vector containing coefficients of variation of component weights w .

Theta: a list of matrices containing component parameters $\theta_{a1.1}$, $\theta_{a2.1}$ and $\theta_{a3.1}$ for $\leq B$ bootstrap datasets.

Theta.se: a list of vectors containing standard errors of component parameters $\theta_{a1.1}$, $\theta_{a2.1}$ and $\theta_{a3.1}$.

Theta.cv: a list of vectors containing coefficients of variation of component parameters $\theta_{a1.1}$, $\theta_{a2.1}$ and $\theta_{a3.1}$.

RNGMIX-class

Class "RNGMIX"

Description

Object of class RNGMIX.

Objects from the Class

Objects can be created by calls of the form `new("RNGMIX", ...)`. Accessor methods for the slots are `a.Dataset.name(x = NULL)`, `a.rseed(x = NULL)`, `a.n(x = NULL)`, `a.Theta(x = NULL)`, `a.Dataset(x = NULL, pos = 0)`, `a.Zt(x = NULL)`, `a.w(x = NULL)`, `a.Variables(x = NULL)`, `a.ymin(x = NULL)` and `a.ymax(x = NULL)`, where x and pos stand for an object of class RNGMIX and a desired slot item, respectively.

Slots

Dataset.name: a character vector containing list names of data frames of size $n \times d$ that d -dimensional datasets are written in.

rseed: set the random seed to any negative integer value to initialize the sequence. The first file in **Dataset.name** corresponds to it. For each next file the random seed is decremented $r_{\text{seed}} = r_{\text{seed}} - 1$. The default value is -1.

n: a vector containing numbers of observations in classes n_l , where number of observations $n = \sum_{l=1}^c n_l$.

Theta: a list containing c parametric family types pdf1. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or circular "vonMises" defined for $0 \leq y_i \leq 2\pi$. Component parameters theta1.1 follow the parametric family types. One of μ_{il} for normal, lognormal, Gumbel and von Mises distributions, θ_{il} for Weibull, gamma, binomial, Poisson and Dirac distributions and a for uniform distribution. Component parameters theta2.1 follow theta1.1. One of σ_{il} for normal, lognormal and Gumbel distributions, β_{il} for Weibull and gamma distributions, p_{il} for binomial distribution, κ_{il} for von Mises distribution and b for uniform distribution. Component parameters theta3.1 follow theta2.1. One of $\xi_{il} \in \{-1, 1\}$ for Gumbel distribution.

Dataset: a list of length n_D of data frames of size $n \times d$ containing d -dimensional datasets. Each of the d columns represents one random variable. Numbers of observations n equal the number of rows in the datasets.

Zt: a factor of true cluster membership.

w: a vector of length c containing component weights w_l summing to 1.

Variables: a character vector containing types of variables. One of "continuous" or "discrete".

ymin: a vector of length d containing minimum observations.

ymax: a vector of length d containing maximum observations.

Author(s)

Marko Nagode

Description

Returns as default the RNGMIX univariate or multivariate random datasets for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities. If **model** equals "RNGMVNORM" multivariate random datasets for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices are returned.

Usage

```
## S4 method for signature 'RNGMIX'
RNGMIX(model = "RNGMIX", Dataset.name = character(),
        rseed = -1, n = numeric(), Theta = list(), ...)
## ... and for other signatures
```

Arguments

model	see Methods section below.
Dataset.name	a character vector containing list names of data frames of size $n \times d$ that d -dimensional datasets are written in.
rseed	set the random seed to any negative integer value to initialize the sequence. The first file in Dataset.name corresponds to it. For each next file the random seed is decremented $r_{\text{seed}} = r_{\text{seed}} - 1$. The default value is -1.
n	a vector containing numbers of observations in classes n_l , where number of observations $n = \sum_{l=1}^c n_l$.
Theta	a list containing c parametric family types pdf1. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or circular "vonMises" defined for $0 \leq y_i \leq 2\pi$. Component parameters theta1.1 follow the parametric family types. One of μ_{il} for normal, lognormal, Gumbel and von Mises distributions, θ_{il} for Weibull, gamma, binomial, Poisson and Dirac distributions and a for uniform distribution. Component parameters theta2.1 follow theta1.1. One of σ_{il} for normal, lognormal and Gumbel distributions, β_{il} for Weibull and gamma distributions, p_{il} for binomial distribution, κ_{il} for von Mises distribution and b for uniform distribution. Component parameters theta3.1 follow theta2.1. One of $\xi_{il} \in \{-1, 1\}$ for Gumbel distribution.
...	currently not used.

Details

RNGMIX is based on the "Minimal" random number generator ran1 of Park and Miller with the Bays-Durham shuffle and added safeguards that returns a uniform random deviate between 0.0 and 1.0 (exclusive of the endpoint values).

Value

Returns an object of class RNGMIX or RNGMVNORM.

Methods

signature(model = "RNGMIX") a character giving the default class name "RNGMIX" for mixtures of conditionally independent normal, lognormal, Weibull, gamma, Gumbel, binomial, Poisson, Dirac, uniform or von Mises component densities.

signature(model = "RNGMVNORM") a character giving the class name "RNGMVNORM" for mixtures of multivariate normal component densities with unrestricted variance-covariance matrices.

RNGMIX.Theta-class	Class "RNGMIX.Theta"
--------------------	----------------------

Description

Object of class RNGMIX.Theta.

Objects from the Class

Objects can be created by calls of the form `new("RNGMIX.Theta", ...)`. Accessor methods for the slots are `a.c(x = NULL)`, `a.d(x = NULL)`, `a.pdf(x = NULL)` and `a.Theta(x = NULL)`, where `x` stands for an object of class RNGMIX.Theta. Setter methods `a.theta1(x = NULL, l = numeric())`, `a.theta2(x = NULL, l = numeric())` and `a.theta3(x = NULL, l = numeric())`, `a.theta1.all(x = NULL)`, `a.theta2.all(x = NULL)` and `a.theta3.all(x = NULL)` are provided to write to Theta slot, where $l = 1, \dots, c$.

Slots

c: number of components $c > 0$. The default value is 1.

d: number of dimensions.

pdf: a character vector of length d containing continuous or discrete parametric family types. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or "vonMises".

Theta: a list containing c parametric family types pdf1. One of "normal", "lognormal", "Weibull", "gamma", "Gumbel", "binomial", "Poisson", "Dirac", "uniform" or circular "vonMises" defined for $0 \leq y_i \leq 2\pi$. Component parameters `theta1.l` follow the parametric family types. One of μ_{il} for normal, lognormal, Gumbel and von Mises distributions, θ_{il} for Weibull, gamma, binomial, Poisson and Dirac distributions and a for uniform distribution. Component parameters `theta2.l` follow `theta1.l`. One of σ_{il} for normal, lognormal and Gumbel distributions, β_{il} for Weibull and gamma distributions, p_{il} for binomial distribution, κ_{il} for von Mises distribution and b for uniform distribution. Component parameters `theta3.l` follow `theta2.l`. One of $\xi_{il} \in \{-1, 1\}$ for Gumbel distribution.

sensorlessdrive

Sensorless Drive Faults Detection Data

Description

These data are the results of a sensorless drive diagnosis procedure. Features are extracted from the electric current drive signals. The drive has intact and defective components. This results in 11 different classes with different conditions. Each condition has been measured several times by 12 different operating conditions, this means by different speeds, load moments and load forces. The current signals are measured with a current probe and an oscilloscope on two phases. The original dataset contains 49 features, however, here only 3 are used, that is, features 5, 7 and 11. First class (1) are the healthy drives and the rest are the drives with fault components.

Usage

```
data(sensorlessdrive)
```

Format

sensorlessdrive is a data frame with 58509 cases (rows) and 4 variables (columns) named:

1. V5 continuous.

2. V7 continuous.
3. V11 continuous.
4. Class discrete 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or 11.

split-methods

*Splits Dataset into Train and Test Datasets***Description**

Returns (invisibly) the object containing train and test observations $y_1, \dots, y_n$ as well as true class membership Ω_g for the test dataset.

Usage

```
## S4 method for signature 'numeric'
split(p = 0.75, Dataset = data.frame(), class = numeric(), ...)
## S4 method for signature 'list'
split(p = list(), Dataset = data.frame(), class = numeric(), ...)
## ... and for other signatures
```

Arguments

<code>p</code>	see Methods section below.
<code>Dataset</code>	a data frame containing dataset Y of length n . For the dataset the corresponding class membership Ω_g is known. The default value is <code>data.frame()</code> .
<code>class</code>	a column number in <code>Dataset</code> containing the class membership information. The default value is <code>numeric()</code> .
<code>...</code>	further arguments to sample .

Value

Returns an object of class `RCLS.chunk`.

Methods

`signature(p = "numeric")` a number specifying the fraction of observations for training $0.0 \leq p \leq 1.0$. The default value is `0.75`.

`signature(p = "list")` a list composed of column number `p$type` in `Dataset` containing the type membership information followed by the corresponding train `p$train` and test `p$test` values. The default value is `list()`.

Author(s)

Marko Nagode

Examples

```

## Not run:
data(iris)

# Split dataset into train (75

set.seed(5)

Iris <- split(p = 0.75, Dataset = iris, class = 5)

Iris

# Generate simulated dataset.

N <- 1000

class <- c(rep("A", 0.4 * N), rep("B", 0.2 * N),
  rep("C", 0.1 * N), rep("D", 0.05 * N), rep("E", 0.25 * N))

type <- c(rep("train", 0.75 * N), rep("test", 0.25 * N))

n <- 300

Dataset <- data.frame(1:n, sample(class, n))

colnames(Dataset) <- c("y", "class")

# Split dataset into train (60

simulated <- split(p = 0.6, Dataset = Dataset, class = 2)

simulated

# Generate simulated dataset.

Dataset <- data.frame(1:n, sample(class, n), sample(type, n))

colnames(Dataset) <- c("y", "class", "type")

# Split dataset into train and test subsets.

simulated <- split(p = list(type = 3, train = "train",
  test = "test"), Dataset = Dataset, class = 2)

simulated

## End(Not run)

```

Description

Returns the sum of squares error at pos.

Usage

```
## S4 method for signature 'REBMIX'
SSE(x = NULL, pos = 1, ...)
## ... and for other signatures
```

Arguments

x	see Methods section below.
pos	a desired row number in x@summary for which the information criterion is calculated. The default value is 1.
...	currently not used.

Methods

signature(x = "REBMIX") an object of class REBMIX.
signature(x = "REBMVNORM") an object of class REBMVNORM.

steelplates

Steel Plates Faults Recognition Data

Description

These data are the results of an extraction process from images of faults of steel plates. There are seven different faults: Pastry (1), Z_Scratch (2), K_Scratch (3), Stains (4), Dirtiness (5), Bumps (6), Other faults (7).

Usage

```
data(steelplates)
```

Format

steelplates is a data frame with 1941 cases (rows) and 28 variables (columns) named:

1. X_Minimum integer.
2. X_Maximum integer.
3. Y_Minimum integer.
4. Y_Maximum integer.
5. Pixels_Areas integer.
6. X_Perimeter integer.
7. Y_Perimeter integer.
8. Sum_of_Luminosity integer.
9. Minimum_of_Luminosity integer.
10. Maximum_of_Luminosity integer.
11. Length_of_Conveyer integer.
12. TypeOfSteel_A300 binary.
13. TypeOfSteel_A400 binary.
14. Steel_Plate_Thickness integer.
15. Edges_Index continuous.
16. Empty_Index continuous.
17. Square_Index continuous.
18. Outside_X_Index continuous.
19. Edges_X_Index continuous.
20. Edges_Y_Index continuous.
21. Outside_Global_Index continuous.
22. LogOfAreas continuous.
23. Log_X_Index continuous.
24. Log_Y_Index continuous.
25. Orientation_Index continuous.
26. Luminosity_Index continuous.
27. SigmoidOfAreas continuous.
28. Class discrete 1, 2, 3, 4, 5, 6 or 7.

truck

Truck Dataset

Description

The dataset contains amplitudes and means measured on a truck wheels.

Usage

```
data(truck)
```

Format

truck is a data frame with 31665 rows and 2 variables (columns) named:

1. Amplitude continuous.
2. Mean continuous.

Author(s)

Mitja Franko

Examples

```
data(truck)
```

weibull

Weibull Dataset 8.1

Description

The complete data are the failure times in weeks.

Usage

```
data(weibull)
```

Format

weibull is a data frame with 50 cases (rows) and 1 variables (columns) named:

1. Failure.Time continuous.

data(weibull)
```

`weibullnormal`*Weibull-normal Simulated Dataset*

Description

The dataset contains amplitudes and means simulated from a three component Weibull-normal mixture.

Usage

```
data(weibullnormal)
```

Format

`weibullnormal` is a data frame with 10000 rows and 2 variables (columns) named:

1. Amplitude continuous.
2. Mean continuous.

Author(s)

Mitja Franko

Examples

```
data(weibullnormal)
```

`wine`*Wine Recognition Data*

Description

These data are the results of a chemical analysis of wines grown in the same region in Italy but derived from three different cultivars (1-3). The analysis determined the quantities of 13 constituents: alcohol, malic acid, ash, alcalinity of ash, magnesium, total phenols, flavanoids, nonflavanoid phenols, proanthocyanins, colour intensity, hue, OD280/OD315 of diluted wines, and proline found in each of the three types of the wines. The number of instances in classes 1 to 3 is 59, 71 and 48, respectively.

Usage

```
data(wine)
```

Format

wine is a data frame with 178 cases (rows) and 14 variables (columns) named:

1. Alcohol continuous.
2. Malic.Acid continuous.
3. Ash continuous.
4. Alcalinity.of.Ash continuous.
5. Magnesium continuous.
6. Total.Phenols continuous.
7. Flavanoids continuous.
8. Nonflavanoid.Phenols continuous.
9. Proanthocyanins continuous.
10. Color.Intensity continuous.
11. Hue continuous.
12. OD280.OD315.of.Diluted.Wines continuous.
13. Proline continuous.
14. Cultivar discrete 1, 2 or 3.
