# Package 'riskyr'

July 23, 2025

Type Package

Title Rendering Risk Literacy more Transparent

**Version** 0.4.0 **Date** 2022-08-15

Maintainer Hansjoerg Neth <h.neth@uni.kn>

**Description** Risk-related information (like the prevalence of conditions, the sensitivity and specificity of diagnostic tests, or the effectiveness of interventions or treatments) can be expressed in terms of frequencies or probabilities. By providing a toolbox of corresponding metrics and representations, 'riskyr' computes, translates, and visualizes risk-related information in a variety of ways. Adopting multiple complementary perspectives provides insights into the interplay between key parameters and renders teaching and training programs on risk literacy more transparent.

**Depends** R (>= 3.4.0) **Imports** utils (>= 3.4.0)

# Description

acc defines overall accuracy as the probability of correspondence between a positive decision and true condition (i.e., the proportion of correct classification decisions or of dec\_cor cases).

acc 5

#### **Usage**

acc

#### **Format**

An object of class numeric of length 1.

#### **Details**

Importantly, correct decisions dec\_cor are not necessarily positive decisions dec\_pos.

Understanding or obtaining the accuracy metric acc:

• Definition: acc is the (non-conditional) probability:

```
acc = p(dec_cor) = dec_cor/N
```

or the base rate (or baseline probability) of a decision being correct, but not necessarily positive

acc values range from 0 (no correct decision/prediction) to 1 (perfect decision/prediction).

• Computation: acc can be computed in several ways:

```
(a) from prob: acc = (prev x sens) + [(1 - prev) x spec]
```

- (b) from freq:  $acc = dec_{cor}/N = (hi + cr)/(hi + mi + fa + cr)$
- (c) as complement of the error rate err: acc = 1 err

When frequencies in freq are not rounded, (b) coincides with (a) and (c).

- Perspective: acc classifies a population of N individuals by accuracy/correspondence (acc = dec\_cor/N).
  - acc is the "by accuracy" or "by correspondence" counterpart to prev (which adopts a "by condition" perspective) and to ppod (which adopts a "by decision" perspective).
- Alternative names: base rate of correct decisions, non-erroneous cases
- In terms of frequencies, acc is the ratio of dec\_cor (i.e., hi + cr) divided by N (i.e., hi + mi + fa + cr):

```
acc = dec_{cor}/N = (hi + cr)/(hi + mi + fa + cr)
```

• Dependencies: acc is a feature of both the environment (true condition) and of the decision process or diagnostic procedure. It reflects the correspondence of decisions to conditions.

See accu for other accuracy metrics and several possible interpretations of accuracy.

6 accu

verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other probabilities: FDR, FOR, NPV, PPV, err, fart, mirt, ppod, prev, sens, spec
Other metrics: accu, comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_err(), err
```

# **Examples**

```
acc <- .50  # sets a rate of correct decisions of 50% acc <- 50/100  # (dec_cor) for 50 out of 100 individuals is_prob(acc)  # TRUE
```

accu

A list containing current accuracy information.

# Description

accu contains current accuracy information returned by the corresponding generating function comp\_accu\_prob.

#### Usage

accu

#### **Format**

An object of class list of length 5.

## **Details**

Current metrics include:

 acc: Overall accuracy as the probability (or proportion) of correctly classifying cases or of dec\_cor cases:

See acc for definition and explanations.

acc values range from 0 (no correct prediction) to 1 (perfect prediction).

2. wacc: Weighted accuracy, as a weighted average of the sensitivity sens (aka. hit rate HR, TPR, power or recall) and the specificity spec (aka. TNR) in which sens is multiplied by a weighting parameter w (ranging from 0 to 1) and spec is multiplied by w's complement (1 - w):

```
wacc = (w * sens) + ((1 - w) * spec)

If w = .50, wacc becomes balanced accuracy bacc.
```

3. mcc: The Matthews correlation coefficient (with values ranging from -1 to +1):

mcc = ((hi \* cr) - (fa \* mi)) / sqrt((hi + fa) \* (hi + mi) \* (cr + fa) \* (cr + mi))

A value of mcc = 0 implies random performance; mcc = 1 implies perfect performance.

See Wikipedia: Matthews correlation coefficient for additional information.

accu 7

4. f1s: The harmonic mean of the positive predictive value PPV (aka. precision) and the sensitivity sens (aka. hit rate HR, TPR, power or recall):

```
f1s = 2 * (PPV * sens) / (PPV + sens)
```

See Wikipedia: F1 score for additional information.

#### Notes:

• Accuracy metrics describe the *correspondence* of decisions (or predictions) to actual conditions (or truth).

There are several possible interpretations of accuracy:

- 1. as *probabilities* (i.e., acc being the probability or proportion of correct classifications, or the ratio dec\_cor/N),
- 2. as *frequencies* (e.g., as classifying a population of N individuals into cases of dec\_cor vs. dec\_err),
- 3. as *correlations* (e.g., see mcc in accu).
- Computing exact accuracy values based on probabilities (by comp\_accu\_prob) may differ from accuracy values computed from (possibly rounded) frequencies (by comp\_accu\_freq).
   When frequencies are rounded to integers (see the default of round = TRUE in comp\_freq and comp\_freq\_prob) the accuracy metrics computed by comp\_accu\_freq correspond to these rounded values. Use comp\_accu\_prob to obtain exact accuracy metrics from probabilities.

#### See Also

The corresponding generating function comp\_accu\_prob computes exact accuracy metrics from probabilities; acc defines accuracy as a probability; comp\_accu\_freq computes accuracy metrics from frequencies; num for basic numeric parameters; freq for current frequency information; prob for current probability information; txt for current text settings.

```
Other lists containing current scenario information: freq, num, pal_bwp, pal_bw, pal_kn, pal_mbw, pal_mod, pal_org, pal_rgb, pal_unikn, pal_vir, pal, prob, txt_TF, txt_org, txt

Other metrics: acc, comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_err(), err
```

# **Examples**

```
accu <- comp_accu_prob() # => compute exact accuracy metrics (from probabilities)
accu # => current accuracy information

## Contrasting comp_accu_freq and comp_accu_prob:
# (a) comp_accu_freq (based on rounded frequencies):
freq1 <- comp_freq(N = 10, prev = 1/3, sens = 2/3, spec = 3/4) # => rounded frequencies!
accu1 <- comp_accu_freq(freq1$hi, freq1$mi, freq1$fa, freq1$cr) # => accu1 (based on rounded freq).
# accu1
#
# (b) comp_accu_prob (based on probabilities):
accu2 <- comp_accu_prob(prev = 1/3, sens = 2/3, spec = 3/4) # => exact accu (based on prob).
# accu2
all.equal(accu1, accu2) # => 4 differences!
#
# (c) comp_accu_freq (exact values, i.e., without rounding):
```

8 as\_pb

```
freq3 <- comp_freq(N = 10, prev = 1/3, sens = 2/3, spec = 3/4, round = FALSE)
accu3 <- comp_accu_freq(freq3$hi, freq3$mi, freq3$fa, freq3$cr) # => accu3 (based on EXACT freq).
# accu3
all.equal(accu2, accu3) # => TRUE (qed).
```

as\_pb

Display a percentage as a (numeric and rounded) probability.

## **Description**

as\_pb is a function that displays a percentage perc as a probability (rounded to n\_digits decimals).

# Usage

```
as_pb(perc, n_digits = 4)
```

# **Arguments**

perc A percentage (as a scalar or vector of numeric values from 0 to 100).

n\_digits Number of decimal places to which percentage is rounded. Default: n\_digits

= 4.

## **Details**

as\_pb and its complement function as\_pc allow toggling the display of numeric values between percentages and probabilities.

# Value

A probability (as a numeric value).

#### See Also

is\_perc verifies a percentage; is\_prob verifies a probability; is\_valid\_prob\_set verifies the validity of probability inputs; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; comp\_complement computes a probability's complement; comp\_comp\_pair computes pairs of complements.

```
Other utility functions: as_pc(), plot.box()
```

Other display functions: as\_pc()

as\_pc 9

# **Examples**

```
as_pb(1/3) # => 0.0033

as_pb(as_pc(2/3)) # => 0.6667 (rounded to 4 decimals)
```

as\_pc

Display a probability as a (numeric and rounded) percentage.

## **Description**

as\_pc is a function that displays a probability prob as a percentage (rounded to n\_digits decimals).

# Usage

```
as_pc(prob, n_digits = 2)
```

# **Arguments**

prob A probability (as a scalar or vector of numeric values from 0 to 1).

n\_digits Number of decimal places to which percentage is rounded. Default: n\_digits = 2.

#### **Details**

as\_pc and its complement function as\_pb allow toggling the display of numeric values between percentages and probabilities.

## Value

A percentage (as a numeric value).

# See Also

is\_prob verifies a probability; is\_perc verifies a percentage; is\_valid\_prob\_set verifies the validity of probability inputs; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; comp\_complement computes a probability's complement; comp\_comp\_pair computes pairs of complements.

```
Other utility functions: as_pb(), plot.box()
Other display functions: as_pb()
```

10 BRCA1\_mam

# **Examples**

```
as_pc(.50) # 50
as_pc(1/3) # 33.33
as_pc(1/3, n_digits = 0) # 33
as_pc(as_pb(12.3)) # 12.3
```

BRCA1

Cumulative risk of breast cancer in women with the BRCA1 mutation.

# **Description**

BRCA1 provides the cumulative risk of breast cancer in a population of women with the BRCA1 mutation as a function of their age (in years).

# Usage

BRCA1

#### **Format**

```
A data frame (11 x 2).

x: age (in years).

y: cumulative risk of developing breast cancer in this (BRCA1) population.
```

#### See Also

```
plot_crisk plots cumulative risk curves. Other datasets: BRCA1_mam, BRCA1_ova, BRCA2_mam, BRCA2_ova, BRCA2, df_scenarios, t_A, t_B, t_I
```

BRCA1\_mam

Cumulative risk of breast cancer in women with the BRCA1 mutation.

# **Description**

BRCA1\_mam provides the cumulative risk of breast cancer in a population of women with the BRCA1 mutation as a function of their age (in years).

# Usage

BRCA1\_mam

BRCA1\_ova

#### **Format**

```
A data frame (63 x 2).

age: age (in years).

cumRisk: cumulative risk of developing breast cancer in this (BRCA1) population.
```

#### Source

Other datasets: BRCA1\_ova, BRCA1, BRCA2\_mam, BRCA2\_ova, BRCA2, df\_scenarios, t\_A, t\_B, t\_I

BRCA1\_ova

Cumulative risk of ovarian cancer in women with the BRCA1 mutation.

## **Description**

BRCA1\_ova provides the cumulative risk of ovarian cancer in a population of women with the BRCA1 mutation as a function of their age (in years).

#### Usage

BRCA1 ova

#### **Format**

```
A data frame (63 x 2).

age: age (in years).

cumRisk: cumulative risk of developing ovarian cancer in this (BRCA1) population.
```

#### Source

Based on Figure 2 (p. 2408) of Kuchenbaecker, K. B., Hopper, J. L., Barnes, D. R., Phillips, K. A., Mooij, T. M., Roos-Blom, M. J., ... & BRCA1 and BRCA2 Cohort Consortium (2017). ```

Other datasets: BRCA1\_mam, BRCA1, BRCA2\_mam, BRCA2\_ova, BRCA2, df\_scenarios, t\_A, t\_B, t\_I

12 BRCA2\_mam

BRCA2

Cumulative risk of breast cancer in women with the BRCA2 mutation.

# **Description**

BRCA2 provides the cumulative risk of breast cancer in a population of women with the BRCA2 mutation as a function of their age (in years).

## Usage

BRCA2

#### **Format**

```
A data frame (11 x 2).

x: age (in years).

y: cumulative risk of developing breast cancer in this (BRCA2) population.
```

## See Also

```
plot_crisk plots cumulative risk curves.

Other datasets: BRCA1_mam, BRCA1_ova, BRCA1, BRCA2_mam, BRCA2_ova, df_scenarios, t_A, t_B, t_I
```

BRCA2\_mam

Cumulative risk of breast cancer in women with the BRCA2 mutation.

# Description

BRCA2\_mam provides the cumulative risk of breast cancer in a population of women with the BRCA2 mutation as a function of their age (in years).

# Usage

```
BRCA2_mam
```

# **Format**

```
A data frame (63 x 2).

age: age (in years).

cumRisk: cumulative risk of developing breast cancer in this (BRCA2) population.
```

BRCA2\_ova 13

## **Source**

14 comp\_acc

comp	acc

Compute overall accuracy (acc) from probabilities.

## **Description**

comp\_acc computes overall accuracy acc from 3 essential probabilities prev, sens, and spec.

#### Usage

```
comp_acc(prev, sens, spec)
```

#### Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

#### **Details**

comp\_acc uses probabilities (not frequencies) as inputs and returns an exact probability (proportion) without rounding.

Understanding the probability acc:

• Definition: acc is the (non-conditional) probability:

```
acc = p(dec_cor) = dec_cor/N
```

or the base rate (or baseline probability) of a decision being correct, but not necessarily positive.

acc values range from 0 (no correct decision/prediction) to 1 (perfect decision/prediction).

• Computation: acc can be computed in 2 ways:

```
(a) from prob: acc = (prev x sens) + [(1 - prev) x spec]
(b) from freq: acc = dec_cor/N = (hi + cr)/(hi + mi + fa + cr)
```

When frequencies in freq are not rounded, (b) coincides with (a).

- Perspective: acc classifies a population of N individuals by accuracy/correspondence (acc = dec\_cor/N).
  - acc is the "by accuracy" or "by correspondence" counterpart to prev (which adopts a "by condition" perspective) and to ppod (which adopts a "by decision" perspective).
- Alternative names of acc: base rate of correct decisions, non-erroneous cases
- In terms of frequencies, acc is the ratio of dec\_cor (i.e., hi + cr) divided by N (i.e., hi + mi + fa + cr):

```
acc = dec_{cor}/N = (hi + cr)/(hi + mi + fa + cr)
```

• Dependencies: acc is a feature of both the environment (true condition) and of the decision process or diagnostic procedure. It reflects the correspondence of decisions to conditions.

See accu for other accuracy metrics and several possible interpretations of accuracy.

comp\_accu\_freq 15

#### Value

Overall accuracy acc as a probability (proportion). A warning is provided for NaN values.

See acc for definition and accu for other accuracy metrics. comp\_accu\_freq and comp\_accu\_prob compute accuracy metrics from frequencies and probabilities.

#### See Also

acc defines accuracy as a probability; accu lists all accuracy metrics; comp\_accu\_prob computes exact accuracy metrics from probabilities; comp\_accu\_freq computes accuracy metrics from frequencies; comp\_sens and comp\_PPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

Other metrics: accu, acc, comp\_accu\_freq(), comp\_accu\_prob(), comp\_err(), err

# **Examples**

16 comp\_accu\_freq

## **Description**

comp\_accu\_freq computes a list of current accuracy metrics from the 4 essential frequencies (hi, mi, fa, cr) that constitute the current confusion matrix and are contained in freq.

#### Usage

```
comp_accu_freq(hi = freq$hi, mi = freq$mi, fa = freq$fa, cr = freq$cr, w = 0.5)
```

# **Arguments**

hi	The number of hits hi (or true positives).
mi	The number of misses mi (or false negatives).
fa	The number of false alarms fa (or false positives).
cr	The number of correct rejections cr (or true negatives).
W	The weighting parameter w (from $0$ to $1$ ) for computing weighted accuracy wacc. Default: w = .50 (i.e., yielding balanced accuracy bacc).

## **Details**

Currently computed accuracy metrics include:

 acc: Overall accuracy as the proportion (or probability) of correctly classifying cases or of dec\_cor cases:

```
acc = dec_cor/N = (hi + cr)/(hi + mi + fa + cr)
```

Values range from 0 (no correct prediction) to 1 (perfect prediction).

2. wacc: Weighted accuracy, as a weighted average of the sensitivity sens (aka. hit rate HR, TPR, power or recall) and the specificity spec (aka. TNR) in which sens is multiplied by a weighting parameter w (ranging from 0 to 1) and spec is multiplied by w's complement (1 - w):

```
wacc = (w * sens) + ((1 - w) * spec)

If w = .50, wacc becomes balanced accuracy bacc.
```

- 3. mcc: The Matthews correlation coefficient (with values ranging from -1 to +1):
  - mcc = ((hi \* cr) (fa \* mi)) / sqrt((hi + fa) \* (hi + mi) \* (cr + fa) \* (cr + mi))

A value of mcc = 0 implies random performance; mcc = 1 implies perfect performance.

See Wikipedia: Matthews correlation coefficient for additional information.

4. f1s: The harmonic mean of the positive predictive value PPV (aka. precision) and the sensitivity sens (aka. hit rate HR, TPR, power or recall):

```
f1s = 2 * (PPV * sens) / (PPV + sens)
```

See Wikipedia: F1 score for additional information.

#### Notes:

• Accuracy metrics describe the *correspondence* of decisions (or predictions) to actual conditions (or truth).

There are several possible interpretations of accuracy:

comp\_accu\_freq 17

 as probabilities (i.e., acc being the proportion of correct classifications, or the ratio dec\_cor/N),

- 2. as *frequencies* (e.g., as classifying a population of N individuals into cases of dec\_cor vs. dec\_err),
- 3. as *correlations* (e.g., see mcc in accu).
- Computing exact accuracy values based on probabilities (by comp\_accu\_prob) may differ from accuracy values computed from (possibly rounded) frequencies (by comp\_accu\_freq).
   When frequencies are rounded to integers (see the default of round = TRUE in comp\_freq and comp\_freq\_prob) the accuracy metrics computed by comp\_accu\_freq correspond to these rounded values. Use comp\_accu\_prob to obtain exact accuracy metrics from probabilities.

#### Value

A list accu containing current accuracy metrics.

#### References

Consult Wikipedia: Confusion matrix for additional information.

#### See Also

accu for all accuracy metrics; comp\_accu\_prob computes exact accuracy metrics from probabilities; num for basic numeric parameters; freq for current frequency information; txt for current text settings; pal for current color settings; popu for a table of the current population.

```
Other metrics: accu, acc, comp_accu_prob(), comp_acc(), comp_err(), err

Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# Examples

```
comp_accu_freq() # => accuracy metrics for freq of current scenario
comp_accu_freq(hi = 1, mi = 2, fa = 3, cr = 4) # medium accuracy, but cr > hi

# Extreme cases:
comp_accu_freq(hi = 1, mi = 1, fa = 1, cr = 1) # random performance
comp_accu_freq(hi = 0, mi = 0, fa = 1, cr = 1) # random performance: wacc and fls are NaN
comp_accu_freq(hi = 1, mi = 0, fa = 0, cr = 1) # perfect accuracy/optimal performance
comp_accu_freq(hi = 0, mi = 1, fa = 1, cr = 0) # zero accuracy/worst performance, but see fls
comp_accu_freq(hi = 1, mi = 0, fa = 0, cr = 0) # perfect accuracy, but see wacc and mcc

# Effects of w:
comp_accu_freq(hi = 3, mi = 2, fa = 1, cr = 4, w = 1/2) # equal weights to sens and spec
comp_accu_freq(hi = 3, mi = 2, fa = 1, cr = 4, w = 2/3) # more weight to sens
comp_accu_freq(hi = 3, mi = 2, fa = 1, cr = 4, w = 1/3) # more weight to spec

## Contrasting comp_accu_freq and comp_accu_prob:
# (a) comp_accu_freq (based on rounded frequencies):
```

18 comp\_accu\_prob

```
freq1 <- comp_freq(N = 10, prev = 1/3, sens = 2/3, spec = 3/4) # => hi = 2, mi = 1, fa = 2, cr = 5
accu1 <- comp_accu_freq(freq1$hi, freq1$mi, freq1$fa, freq1$cr) # => accu1 (based on rounded freq).
# accu1
#
# (b) comp_accu_prob (based on probabilities):
accu2 <- comp_accu_prob(prev = 1/3, sens = 2/3, spec = 3/4) # => exact accu (based on prob).
# accu2
all.equal(accu1, accu2) # => 4 differences!
#
# (c) comp_accu_freq (exact values, i.e., without rounding):
freq3 <- comp_freq(N = 10, prev = 1/3, sens = 2/3, spec = 3/4, round = FALSE)
accu3 <- comp_accu_freq(freq3$hi, freq3$mi, freq3$fa, freq3$cr) # => accu3 (based on EXACT freq).
# accu3
all.equal(accu2, accu3) # => TRUE (qed).
```

comp\_accu\_prob

Compute exact accuracy metrics based on probabilities.

## Description

comp\_accu\_prob computes a list of exact accuracy metrics from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart).

# Usage

```
comp_accu_prob(
  prev = prob$prev,
  sens = prob$sens,
  mirt = NA,
  spec = prob$spec,
  fart = NA,
  tol = 0.01,
  w = 0.5
)
```

## **Arguments**

prev The condition's prevalence prev (i.e., the probability of condition being TRUE).

sens The decision's sensitivity sens (i.e., the conditional probability of a positive

decision provided that the condition is TRUE). sens is optional when its comple-

ment mirt is provided.

mirt The decision's miss rate mirt (i.e., the conditional probability of a negative deci-

sion provided that the condition is TRUE). mirt is optional when its complement

sens is provided.

comp\_accu\_prob

spec The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE), spec is optional when its

complement fart is provided.

fart The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its

complement spec is provided.

tol A numeric tolerance value for is\_complement. Default: tol = .01.

The weighting parameter w (from 0 to 1) for computing weighted accuracy wacc. Default: w = .50 (i.e., yielding balanced accuracy bacc).

Notes:

 Accuracy metrics describe the *correspondence* of decisions (or predictions) to actual conditions (or truth).

There are several possible interpretations of accuracy:

- 1. as *probabilities* (i.e., acc being the proportion of correct classifications, or the ratio dec\_cor/N),
- 2. as *frequencies* (e.g., as classifying a population of N individuals into cases of dec\_cor vs. dec\_err),
- 3. as *correlations* (e.g., see mcc in accu).
- Computing exact accuracy values based on probabilities (by comp\_accu\_prob)
  may differ from accuracy values computed from (possibly rounded) frequencies (by comp\_accu\_freq).

When frequencies are rounded to integers (see the default of round = TRUE in comp\_freq and comp\_freq\_prob) the accuracy metrics computed by comp\_accu\_freq correspond to these rounded values. Use comp\_accu\_prob to obtain exact accuracy metrics from probabilities.

# **Details**

Currently computed accuracy metrics include:

 acc: Overall accuracy as the proportion (or probability) of correctly classifying cases or of dec\_cor cases:

```
(a) from prob: acc = (prev x sens) + [(1 - prev) x spec]
```

(b) from freq: acc = dec\_cor/N = (hi + cr)/(hi + mi + fa + cr)

When frequencies in freq are not rounded, (b) coincides with (a).

Values range from 0 (no correct prediction) to 1 (perfect prediction).

2. wacc: Weighted accuracy, as a weighted average of the sensitivity sens (aka. hit rate HR, TPR, power or recall) and the specificity spec (aka. TNR) in which sens is multiplied by a weighting parameter w (ranging from 0 to 1) and spec is multiplied by w's complement (1 - w):

```
wacc = (w * sens) + ((1 - w) * spec)
```

If w = .50, wacc becomes *balanced* accuracy bacc.

3. mcc: The Matthews correlation coefficient (with values ranging from -1 to +1):

```
mcc = ((hi * cr) - (fa * mi)) / sqrt((hi + fa) * (hi + mi) * (cr + fa) * (cr + mi))
```

A value of mcc = 0 implies random performance; mcc = 1 implies perfect performance.

See Wikipedia: Matthews correlation coefficient for additional information.

20 comp\_accu\_prob

4. f1s: The harmonic mean of the positive predictive value PPV (aka. precision) and the sensitivity sens (aka. hit rate HR, TPR, power or recall):
f1s = 2 \* (PPV \* sens) / (PPV + sens)

See Wikipedia: F1 score for additional information.

Note that some accuracy metrics can be interpreted as probabilities (e.g., acc) and some as correlations (e.g., mcc).

Also, accuracy can be viewed as a probability (e.g., the ratio of or link between dec\_cor and N) or as a frequency type (containing dec\_cor and dec\_err).

comp\_accu\_prob computes exact accuracy metrics from probabilities. When input frequencies were rounded (see the default of round = TRUE in comp\_freq and comp\_freq\_prob) the accuracy metrics computed by comp\_accu correspond these rounded values.

#### Value

A list accu containing current accuracy metrics.

# References

Consult Wikipedia: Confusion matrix for additional information.

# accu3
all.equal(accu2, accu3) # => TRUE (qed).
```

comp\_complement

Compute a probability's complement probability.

# **Description**

comp\_complement computes the probability complement of a given probability prob.

# Usage

```
comp_complement(prob)
```

#### Arguments

prob

A numeric probability value (in range from 0 to 1).

## **Details**

The type and range of prob is verified with is\_prob.

## Value

A numeric probability value (in range from 0 to 1).

## See Also

is\_complement verifies numeric complements; comp\_comp\_pair returns a probability and its complement; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# Examples

```
comp_complement(0)  # => 1
comp_complement(1)  # => 0

comp_complement(2)  # => NA + warning (beyond range)
comp_complement("p")  # => NA + warning (non-numeric)
```

```
comp_complete_prob_set
```

Compute a complete set of probabilities from valid probability inputs.

## **Description**

comp\_complete\_prob\_set is a function takes a valid set of (3 to 5) probabilities as inputs (as a vector) and returns the complete set of (3 essential and 2 optional) probabilities.

# Usage

```
comp_complete_prob_set(prev, sens = NA, mirt = NA, spec = NA, fart = NA)
```

#### Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

comp\_comp\_pair 23

#### **Details**

Assuming that is\_valid\_prob\_set = TRUE this function uses comp\_comp\_pair on the two optional pairs (i.e., sens and mirt, and spec and fart) and returns the complete set of 5 probabilities.

#### Value

```
A vector of 5 probabilities: c(prev, sens, mirt, spec, fart).
```

#### See Also

is\_valid\_prob\_set verifies a set of probability inputs; is\_extreme\_prob\_set verifies extreme cases; comp\_comp\_pair computes pairs of complements; is\_complement verifies numeric complements; is\_prob verifies probabilities; comp\_prob computes current probability information; prob contains current probability information; init\_num initializes basic numeric variables; num contains basic numeric variables.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# **Examples**

```
# ways to work:
comp_complete_prob_set(1, .8, NA, .7, NA) # => 1.0 0.8 0.2 0.7 0.3
comp_complete_prob_set(1, NA, .8, NA, .4) # => 1.0 0.2 0.8 0.6 0.4

# watch out for:
comp_complete_prob_set(8) # => 8 NA NA NA NA + warnings
comp_complete_prob_set(8, 7, 6, 5, 4) # => 8 7 6 5 4 + no warning (valid set assumed)
comp_complete_prob_set(8, .8, NA, .7, NA) # => 8.0 0.8 0.2 0.7 0.3 + no warning (sic)
comp_complete_prob_set(8, 2, NA, 3, NA) # => 8 2 NA 3 NA + no warning (sic)
```

comp\_comp\_pair

Compute a probability's (missing) complement and return both.

# **Description**

comp\_comp\_pair is a function that takes 0, 1, or 2 probabilities (p1 and p2) as inputs. If either of them is missing (NA), it computes the complement of the other one and returns both probabilities.

## Usage

```
comp\_comp\_pair(p1 = NA, p2 = NA)
```

24 comp\_comp\_pair

#### **Arguments**

p1	A numeric probability value (in range from 0 to 1). p1 is optional when p2 is provided.
p2	A numeric probability value (in range from 0 to 1). p2 is optional when p1 is provided.

## Details

```
comp_comp_pair does nothing when both arguments are provided (i.e., !is.na(p1) & !is.na(p2)) and only issues a warning if both arguments are missing (i.e., is.na(p1) & is.na(p2)).
```

Inputs are *not* verified: Use is\_prob to verify that an input is a probability and is\_complement to verify that two provided values actually are complements.

#### Value

A vector v containing 2 numeric probability values (in range from 0 to 1): v = c(p1, p2).

## See Also

is\_complement verifies numeric complements; is\_valid\_prob\_set verifies sets of probabilities; comp\_complete\_prob\_set completes valid sets of probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

## **Examples**

```
# ways to work:
comp_comp_pair(1, 0)  # => 1 0
comp_comp_pair(0, 1)  # => 0 1
comp_comp_pair(1, NA)  # => 1 0
comp_comp_pair(NA, 1)  # => 0 1

# watch out for:
comp_comp_pair(NA, NA)  # => NA NA + warning
comp_comp_pair(8, 8)  # => 8 8 + NO warning (as is_prob is not verified)
comp_comp_pair(1, 1)  # => 1 1 + NO warning (as is_complement is not verified)
```

comp\_err 25

comp_err	Compute overall error rate (err) from probabilities.	

# **Description**

comp\_err computes overall error rate err from 3 essential probabilities prev, sens, and spec.

# Usage

```
comp_err(prev, sens, spec)
```

#### **Arguments**

prev	The condition's prevalence $\ensuremath{prev}$ (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

#### **Details**

```
comp_err uses comp_acc to compute err as the complement of acc:
err = 1 - acc
```

See comp\_acc and acc for further details and accu for other accuracy metrics and several possible interpretations of accuracy.

# Value

Overall error rate err as a probability (proportion). A warning is provided for NaN values.

# See Also

comp\_acc computes overall accuracy acc from probabilities; accu lists all accuracy metrics; comp\_accu\_prob computes exact accuracy metrics from probabilities; comp\_accu\_freq computes accuracy metrics from frequencies; comp\_sens and comp\_PPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

Other metrics: accu, acc, comp\_accu\_freq(), comp\_accu\_prob(), comp\_acc(), err

26 comp\_fart

## **Examples**

comp\_fart

Compute a decision's false alarm rate from its specificity.

# Description

comp\_fart is a conversion function that takes a specificity spec – given as a probability (i.e., a numeric value in the range from 0 to 1) – as its input, and returns the corresponding false alarm rate fart – also as a probability – as its output.

# Usage

```
comp_fart(spec)
```

## **Arguments**

spec

The decision's specificity value spec as a probability.

## **Details**

The false alarm rate fart and specificity spec are complements (fart = (1 - spec)) and both features of the decision process (e.g., a diagnostic test).

The function comp\_fart is complementary to the conversion function comp\_spec and uses the generic function comp\_complement.

comp\_FDR 27

## Value

The decision's false alarm rate fart as a probability.

#### See Also

comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

## **Examples**

comp\_FDR

Compute a decision's false detection rate (FDR) from probabilities.

# Description

comp\_FDR computes the false detection rate FDR from 3 essential probabilities prev, sens, and spec.

# Usage

```
comp_FDR(prev, sens, spec)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

# **Details**

comp\_FDR uses probabilities (not frequencies) and does not round results.

## Value

The false detection rate FDR as a probability. A warning is provided for NaN values.

28 comp\_FOR

## See Also

comp\_sens and comp\_PPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# **Examples**

```
# (1) Ways to work:

comp_FDR(.50, .500, .500) # => FDR = 0.5 = (1 - PPV)

comp_FDR(.50, .333, .666) # => FDR = 0.5007 = (1 - PPV)
```

comp\_FOR

Compute a decision's false omission rate (FOR) from probabilities.

## **Description**

comp\_FOR computes the false omission rate FOR from 3 essential probabilities prev, sens, and spec.

# Usage

```
comp_FOR(prev, sens, spec)
```

# Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity $sens$ (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

# **Details**

comp\_FOR uses probabilities (not frequencies) and does not round results.

#### Value

The false omission rate FOR as a probability. A warning is provided for NaN values.

comp\_freq 29

## See Also

comp\_spec and comp\_NPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# **Examples**

```
# (1) Ways to work:

comp_FOR(.50, .500, .500) # => FOR = 0.5 = (1 - NPV)

comp_FOR(.50, .333, .666) # => FOR = 0.5004 = (1 - NPV)
```

comp\_freq

Compute frequencies from (3 essential) probabilities.

# **Description**

comp\_freq computes frequencies (typically as rounded integers) given 3 basic probabilities – prev, sens, and spec – for a population of N individuals. It returns a list of 11 key frequencies freq as its output.

## Usage

```
comp_freq(
  prev = num$prev,
  sens = num$sens,
  spec = num$spec,
  N = num$N,
  round = TRUE,
  sample = FALSE
)
```

#### Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).
N	The number of individuals in the population. If N is unknown (NA), a suitable minimum value is computed by comp_min_N.

30 comp\_freq

round Boolean value that determines whether frequency values are rounded to the near-

est integer. Default: round = TRUE.

Note: Removed n\_digits parameter: Number of digits to which frequency values are to be rounded when round = FALSE. Default: n\_digits = 5.

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

Note: Sampling uses sample() and returns integer values.

#### **Details**

In addition to prev, both sens and spec are necessary arguments. If only their complements mirt or fart are known, use the wrapper function comp\_freq\_prob which also accepts mirt and fart as inputs (but requires that the entire set of provided probabilities is sufficient and consistent). Alternatively, use comp\_complement, comp\_comp\_pair, or comp\_complete\_prob\_set to obtain the 3 essential probabilities.

comp\_freq is the frequency counterpart to the probability function comp\_prob.

By default, comp\_freq and its wrapper function comp\_freq\_prob round frequencies to nearest integers to avoid decimal values in freq (i.e., round = TRUE by default). When frequencies are rounded, probabilities computed from freq may differ from exact probabilities. Using the option round = FALSE turns off rounding.

Key relationships between probabilities and frequencies:

• Three perspectives on a population:

A population of N individuals can be split into 2 subsets of frequencies in 3 different ways:

1. by condition:

```
N = cond_true + cond_false
```

The frequency cond\_true depends on the prevalence prev and the frequency cond\_false depends on the prevalence's complement 1 - prev.

2. by decision:

```
N = dec_pos + dec_neg
```

The frequency dec\_pos depends on the proportion of positive decisions ppod and the frequency dec\_neg depends on the proportion of negative decisions 1 - ppod.

3. by accuracy (i.e., correspondence of decision to condition):

```
N = dec_cor + dec_err
```

Each perspective combines 2 pairs of the 4 essential probabilities (hi, mi, fa, cr).

When providing probabilities, the population size N is a free parameter (independent of the essential probabilities prev, sens, and spec).

If N is unknown (NA), a suitable minimum value can be computed by comp\_min\_N.

• Defining probabilities in terms of frequencies:

Probabilities *are* – determine, describe, or are defined as – the relationships between frequencies. Thus, they can be computed as ratios between frequencies:

```
1. prevalence prev:
```

```
prev = cond_true/N = (hi + mi) / (hi + mi + fa + cr)
```

2. sensitivity sens:

```
sens = hi/cond_true = hi / (hi + mi) = (1 - mirt)
```

comp\_freq 31

```
3. miss rate mirt:
   mirt = mi/cond_true = mi / (hi + mi) = (1 - sens)
4. specificity spec:
    spec = cr/cond_false = cr / (fa + cr) = (1 - fart)
 5. false alarm rate fart:
    fart = fa/cond_false = fa / (fa + cr) = (1 - spec)
 6. proportion of positive decisions ppod:
    ppod = dec_pos/N = (hi + fa) / (hi + mi + fa + cr)
 7. positive predictive value PPV:
    PPV = hi/dec_pos = hi / (hi + fa) = (1 - FDR)
 8. negative predictive value NPV:
    NPV = cr/dec_neg = cr/(mi + cr) = (1 - FOR)
 9. false detection rate FDR:
    FDR = fa/dec_pos = fa/(hi + fa) = (1 - PPV)
10. false omission rate FOR:
    FOR = mi/dec_neg = mi/(mi + cr) = (1 - NPV)
11. accuracy acc:
    acc = dec_{cor}/N = (hi + cr) / (hi + mi + fa + cr)
12. rate of hits, given accuracy p_acc_hi:
    p_acc_hi = hi/dec_cor = (1 - cr/dec_cor)
13. rate of false alarms, given inaccuracy p_err_fa:
    p_err_fa = fa/dec_err = (1 - mi/dec_err)
```

Beware of rounding and sampling issues! If frequencies are rounded (by round = TRUE in comp\_freq) or sampled from probabilities (by sample = TRUE), then any probabilities computed from freq may differ from original and exact probabilities.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

## Value

A list freq containing 11 key frequency values.

## See Also

comp\_freq\_prob corresponding wrapper function; num contains basic numeric variables; init\_num initializes basic numeric variables; freq contains current frequency information; prob contains current probability information; comp\_prob computes current probability information; comp\_complement computes a probability's complement; comp\_comp\_pair computes pairs of complements; comp\_complete\_prob\_set completes valid sets of probabilities; comp\_min\_N computes a suitable population size N (if missing).

Other functions computing frequencies: comp\_freq\_freq(), comp\_freq\_prob(), comp\_min\_N(), comp\_prob\_prob()

32 comp\_freq\_freq

## **Examples**

```
# ok, using current defaults
comp_freq()
length(comp_freq()) # 11 key frequencies
# Rounding:
comp_freq(prev = .5, sens = .5, spec = .5, N = 1) # yields fa = 1 (see ?round for reason)
comp_freq(prev = .1, sens = .9, spec = .8, N = 10) # 1 hit (TP, rounded)
comp_freq(prev = .1, sens = .9, spec = .8, N = 10, round = FALSE)  # hi = .9
comp_freq(prev = 1/3, sens = 6/7, spec = 2/3, N = 1, round = FALSE) # hi = 0.2857143
# Sampling (from probabilistic description):
comp_freq_prob(prev = .5, sens = .5, spec = .5, N = 100, sample = TRUE) # freq values vary
# Extreme cases:
comp_freq(prev = 1, sens = 1, spec = 1, 100) # ok, N hits (TP)
comp_freq(prev = 1, sens = 1, spec = 0, 100) # ok, N hits
comp_freq(prev = 1, sens = 0, spec = 1, 100) # ok, N misses (FN)
comp_freq(prev = 1, sens = 0, spec = 0, 100) # ok, N misses
comp_freq(prev = 0, sens = 1, spec = 1, 100) # ok, N correct rejections (TN)
comp_freq(prev = 0, sens = 1, spec = 0, 100) # ok, N false alarms (FP)
# Watch out for:
comp\_freq(prev = 1, sens = 1, spec = 1, N = NA) # ok, but warning that N = 1 was computed
comp_freq(prev = 1, sens = 1, spec = 1, N = 0) # ok, but all 0 + warning (extreme case: N hits)
comp_freq(prev = .5, sens = .5, spec = .5, N = 10, round = TRUE) # ok, rounded (see mi and fa)
comp_freq(prev = .5, sens = .5, spec = .5, N = 10, round = FALSE) # ok, not rounded
# Ways to fail:
comp_freq(prev = NA, sens = 1, spec = 1, 100) # NAs + warning (prev NA)
comp_freq(prev = 1, sens = NA, spec = 1, 100)
                                                 # NAs + warning (sens NA)
comp_freq(prev = 1, sens = 1, spec = NA, 100)
                                                 # NAs + warning (spec NA)
comp_freq(prev = 8, sens = 1, spec = 1, 100)
                                                 # NAs + warning (prev beyond range)
comp_freq(prev = 1, sens = 8, spec = 1, 100) # NAs + warning (sens beyond range)
```

comp\_freq\_freq

Compute frequencies from (4 essential) frequencies.

#### **Description**

comp\_freq\_freq computes current frequency information from 4 essential frequencies (hi, mi, fa, cr). It returns a list of 11 frequencies freq for a population of N individuals as its output.

#### Usage

```
comp_freq_freq(hi = freq$hi, mi = freq$mi, fa = freq$fa, cr = freq$cr)
```

comp\_freq\_freq 33

## Arguments

hi	The number of hits hi (or true positives).
mi	The number of misses mi (or false negatives).
fa	The number of false alarms fa (or false positives).
cr	The number of correct rejections <b>cr</b> (or true negatives).

#### Details

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

#### See Also

comp\_freq\_prob computes current frequency information from (3 essential) probabilities; comp\_prob\_freq computes current probability information from (4 essential) frequencies; comp\_prob\_prob computes current probability information from (3 essential) probabilities; num contains basic numeric parameters; init\_num initializes basic numeric parameters; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; is\_prob verifies probability inputs; is\_freq verifies frequency inputs.

Other functions computing frequencies: comp\_freq\_prob(), comp\_freq(), comp\_min\_N(), comp\_prob\_prob()
Other format conversion functions: comp\_freq\_prob(), comp\_prob\_freq(), comp\_prob\_prob()

# **Examples**

```
## Basics:
comp_freq_freq()
all.equal(freq, comp_freq_freq()) # => should be TRUE

## Circular chain:
# 1. Current numeric parameters:
num

# 2. Compute all 10 probabilities in prob (from essential probabilities):
prob <- comp_prob()
prob

# 3. Compute 9 frequencies in freq from probabilities:
freq <- comp_freq(round = FALSE) # no rounding (to obtain same probabilities later)
freq</pre>
```

34 comp\_freq\_prob

```
# 4. Compute 9 frequencies AGAIN (but now from frequencies):
freq_freq <- comp_freq_freq()

# 5. Check equality of results (steps 2. and 4.):
all.equal(freq, freq_freq) # => should be TRUE!
```

comp\_freq\_prob

Compute frequencies from (3 essential) probabilities.

# Description

comp\_freq\_prob computes frequency information from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart). It returns a list of 11 key frequencies (freq) as its output.

# Usage

```
comp_freq_prob(
  prev = prob$prev,
  sens = prob$sens,
  mirt = NA,
  spec = prob$spec,
  fart = NA,
  tol = 0.01,
  N = freq$N,
  round = TRUE,
  sample = FALSE
)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

comp\_freq\_prob 35

A numeric tolerance value for is\_complement. Default: tol = .01.

The number of individuals in the population. If N is unknown (NA), a suitable minimum value is computed by comp\_min\_N.

A Boolean value that determines whether frequencies are rounded to the nearest integer. Default: round = TRUE.

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

Note: Sampling uses sample() and returns integer values.

#### **Details**

comp\_freq\_prob is a wrapper function for the more basic function comp\_freq, which only accepts 3 essential probabilities (i.e., prev, sens, and spec) as inputs.

Defaults and constraints:

#### · Initial values:

By default, the values of prev, sens, and spec are initialized to the probability information currently contained in prob.

Similarly, the population size N uses the frequency information currently contained in freq as its default. If N is unknown (NA), a suitable minimum value is computed by comp\_min\_N.

#### • Constraints:

When using comp\_freq\_prob with the arguments mirt and fart, their complements sens and spec must either be valid complements (as in is\_complement) or set to NA.

In addition to prev, both sens and spec are necessary arguments. If only their complements mirt or fart are known, first use comp\_complement, comp\_comp\_pair, or comp\_complete\_prob\_set to compute the 3 essential probabilities.

## • Rounding:

By default, comp\_freq\_prob and its basic function comp\_freq round frequencies to nearest integers to avoid decimal values in freq (i.e., round = TRUE by default).

When frequencies are rounded, probabilities computed from freq may differ from exact probabilities.

Using the option round = FALSE turns off rounding.

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding and sampling issues!

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

36 comp\_freq\_prob

#### Value

A list freq containing 11 key frequency values.

#### See Also

#### **Examples**

```
# Basics:
comp_freq_prob(prev = .1, sens = .9, spec = .8, N = 100) # ok: hi = 9, ... cr = 72.
# Same case with complements (using NAs to prevent defaults):
comp_freq_prob(prev = .1, sens = NA, mirt = .1, spec = NA, fart = .2, N = 100) # same result
comp_freq_prob()
                                 # ok, using probability info currently contained in prob
length(comp_freq_prob())
                                   # list of 11 key frequencies
all.equal(freq, comp_freq_prob()) # TRUE, unless prob has been changed after computing freq
                                  # computes frequencies and stores them in freq
freq <- comp_freq_prob()</pre>
# Ways to work:
comp_freq_prob(prev = 1, sens = 1, spec = 1, N = 101) # ok + warning: N hits (TP)
# Same case with complements (note NAs to prevent default arguments):
comp_freq_prob(prev = 1, sens = NA, mirt = 0, spec = NA, fart = 0, N = 101)
comp_freq_prob(prev = 1, sens = 1, spec = 0, N = 102) # ok + warning: N hits (TP)
comp_freq_prob(prev = 1, sens = 0, spec = 1, N = 103) # ok + warning: N misses (FN)
comp_freq_prob(prev = 1, sens = 0, spec = 0, N = 104) # ok + warning: N misses (FN)
comp_freq_prob(prev = 0, sens = 1, spec = 1, N = 105) # ok + warning: N correct rejections (TN)
comp_freq_prob(prev = 0, sens = 1, spec = 0, N = 106) # ok + warning: N false alarms (FP)
# Same case with complements (using NAs to prevent defaults):
comp_freq_prob(prev = 0, sens = NA, mirt = 0,
               spec = NA, fart = 1, N = 106) # ok + warning: N false alarms (FP)
# Rounding:
comp_freq_prob(prev = .5, sens = .5, spec = .5, N = 1) # yields fa = 1 (see ?round for reason)
comp_freq_prob(prev = .1, sens = .9, spec = .8, N = 10) # 1 hit (TP, rounded)
comp_freq_prob(prev = .1, sens = .9, spec = .8, N = 10, round = FALSE) # hi = .9
```

comp\_min\_N 37

```
# Sampling (from probabilistic description):
comp_freq_prob(prev = .5, sens = .5, spec = .5, N = 100, sample = TRUE) # freq values vary

# Watch out for:
comp_freq_prob(prev = 1, sens = 1, spec = 1, N = NA) # ok + warning: N = 1 computed
comp_freq_prob(prev = 1, sens = 1, spec = 1, N = 0) # ok, but all 0 + warning (NPV = NaN)
comp_freq_prob(prev = .5, sens = .5, spec = .5, N = 10, round = TRUE) # ok, but all rounded
comp_freq_prob(prev = .5, sens = .5, spec = .5, N = 10, round = FALSE) # ok, but not rounded

# Ways to fail:
comp_freq_prob(prev = NA, sens = 1, spec = 1, 100) # NAs + no warning (prev NA)
comp_freq_prob(prev = 1, sens = NA, spec = 1, 100) # NAs + no warning (sens NA)
comp_freq_prob(prev = 8, sens = 1, spec = 1, 100) # NAs + warning (prev beyond range)
comp_freq_prob(prev = 1, sens = 8, spec = 1, 100) # NAs + warning (sens & spec beyond range)
```

comp\_min\_N

Compute a suitable minimum population size value N.

# **Description**

comp\_min\_N computes a population size value N (an integer as a power of 10) so that the frequencies of the 4 combinations of conditions and decisions (i.e., the cells of the confusion table, or center row of boxes in the frequency prism) reach or exceed a minimum value min\_freq given the basic parameters prev, sens, and spec (spec = 1 - fart).

# Usage

```
comp_min_N(prev, sens, spec, min_freq = 1)
```

# **Arguments**

prev	The condition's prevalence value prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity value sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).
min_freq	The minimum frequency of each combination of a condition and a decision (i.e., hits, misses, false alarms, and correct rejections). Default: min_freq = 1.

# **Details**

Using this function helps avoiding excessively small decimal values in categories – especially hi, mi, fa, cr – when expressing combinations of conditions and decisions as natural frequencies. As values of zero (0) are tolerable, the function only increases N (in powers of 10) while the current

38 comp\_mirt

value of any frequency (cell in confusion table or leaf of a frequency tree) is positive but below min\_freq.

By default, comp\_freq\_prob and comp\_freq round frequencies to nearest integers to avoid decimal values in freq (i.e., round = TRUE by default). Using the option round = FALSE turns off rounding.

### Value

An integer value N (as a power of 10).

### See Also

population size N; num contains basic numeric parameters; freq contains current frequency information; comp\_freq computes frequencies from probabilities; prob contains current probability information; comp\_prob computes probabilities from probabilities; comp\_freq\_freq computes current frequency information from (4 essential) frequencies; comp\_prob\_freq computes current frequency information from (3 essential) probabilities; comp\_prob\_freq computes current probability information from (4 essential) frequencies; comp\_prob\_prob computes current probability information from (3 essential) probabilities.

Other functions computing frequencies: comp\_freq\_freq(), comp\_freq\_prob(), comp\_freq(), comp\_prob\_prob()

# **Examples**

```
comp_min_N(0, 0, 0) # => 1
comp_min_N(1, 1, 1) # => 1

comp_min_N(1, 1, 1, min_freq = 10) # => 10
comp_min_N(1, 1, 1, min_freq = 99) # => 100

comp_min_N(.1, .1, .1) # => 100 = 10^2
comp_min_N(.001, .1, .1) # => 10 000 = 10^4
comp_min_N(.001, .001, .1) # => 1 000 000 = 10^6
comp_min_N(.001, .001, .001) # => 1 000 000 = 10^6
```

comp\_mirt

Compute a decision's miss rate from its sensitivity.

# **Description**

comp\_mirt is a conversion function that takes a sensitivity sens – given as a probability (i.e., a numeric value in the range from 0 to 1) – as its input, and returns the corresponding miss rate mirt – also as a probability – as its output.

# Usage

```
comp_mirt(sens)
```

comp\_NPV 39

# **Arguments**

sens

The decision's sensitivity sens as a probability.

#### **Details**

The miss rate mirt and sensitivity sens are complements (mirt = (1 - sens)) and both features of the decision process (e.g., a diagnostic test).

The function comp\_mirt is complementary to the conversion function comp\_sens and uses the generic function comp\_complement.

# Value

The decision's miss rate mirt as a probability.

# See Also

comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```

```

# **Examples**

comp\_NPV

Compute a decision's negative predictive value (NPV) from probabilities.

# **Description**

comp\_NPV computes the negative predictive value NPV from 3 essential probabilities prev, sens, and spec.

# Usage

```
comp_NPV(prev, sens, spec)
```

40 comp\_NPV

### **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

### **Details**

comp\_NPV uses probabilities (not frequencies) and does not round results.

# Value

The negative predictive value NPV as a probability. A warning is provided for NaN values.

# See Also

comp\_spec and comp\_PPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens(), comp_spec()
```

# **Examples**

```
# (1) Ways to work:
comp_NPV(.50, .500, .500)  # => NPV = 0.5
comp_NPV(.50, .333, .666)  # => NPV = 0.4996

# (2) Watch out for vectors:
prev <- seq(0, 1, .1)
comp_NPV(prev, .5, .5)  # => without NaN values
comp_NPV(prev, 1, 0)  # => with NaN values

# (3) Watch out for extreme values:
comp_NPV(1, 1, 1)  # => NaN, as cr = 0 and mi = 0: 0/0
comp_NPV(1, 1, 0)  # => NaN, as cr = 0 and mi = 0: 0/0
comp_NPV(.5, sens = 1, spec = 0)  # => NaN, no dec_neg cases: NPV = 0/0 = NaN is_extreme_prob_set(.5, sens = 1, spec = 0)  # => verifies extreme cases
```

comp\_popu 41

comp\_popu

Compute a population table (data) from frequencies (description).

# **Description**

comp\_popu computes a table popu (as an R data frame) from the current frequency information (contained in freq).

# Usage

```
comp_popu(
  hi = freq$hi,
 mi = freq$mi,
  fa = freq$fa,
  cr = freq$cr,
  cond_lbl = txt$cond_lbl,
  cond_true_lbl = txt$cond_true_lbl,
  cond_false_lbl = txt$cond_false_lbl,
  dec_lbl = txt$dec_lbl,
  dec_pos_lbl = txt$dec_pos_lbl,
  dec_neg_lbl = txt$dec_neg_lbl,
  sdt_lbl = txtsdt_lbl,
  hi_lbl = txt$hi_lbl,
 mi_lbl = txt$mi_lbl,
  fa_lbl = txt$fa_lbl,
  cr_lbl = txt$cr_lbl
)
```

# **Arguments**

```
hi
                  The number of hits hi (or true positives).
                  The number of misses mi (or false negatives).
mi
fa
                  The number of false alarms fa (or false positives).
                  The number of correct rejections cr (or true negatives).
cr
cond_lbl
                  Text label for condition dimension ("by cd" perspective).
                  Text label for cond_true cases.
cond_true_lbl
cond_false_lbl Text label for cond_false cases.
dec_lbl
                  Text label for decision dimension ("by dc" perspective).
dec_pos_lbl
                  Text label for dec_pos cases.
dec_neg_lbl
                  Text label for dec_neg cases.
sdt_lbl
                  Text label for 4 cases/combinations (SDT classifications).
hi_lbl
                  Text label for hi cases.
mi_lbl
                  Text label for mi cases.
fa_lbl
                  Text label for fa cases.
cr_lbl
                  Text label for cr cases.
```

42 comp\_popu

### **Format**

An object of class data.frame with N rows and 3 columns (e.g., "X/truth/cd", "Y/test/dc", "SDT/cell/class").

# **Details**

By default, comp\_popu uses the text settings contained in txt.

A visualization of the current population popu is provided by plot\_icons.

#### Value

A data frame popu containing N rows (individual cases) and 3 columns (e.g., "X/truth/cd", "Y/test/dc", "SDT/cell/class"). encoded as ordered factors (with 2, 2, and 4 levels, respectively).

#### See Also

read\_popu creates a scenario (description) from data (as df); write\_popu creates data (as df) from a riskyr scenario (description); popu for data format; num for basic numeric parameters; freq for current frequency information; txt for current text settings; pal for current color settings.

Other functions converting data/descriptions: read\_popu(), write\_popu()

# **Examples**

comp\_ppod 43

comp_ppod	Compute the proportion of positive decisions (ppod) from probabilities.

# **Description**

comp\_ppod computes the proportion of positive decisions ppod from 3 essential probabilities prev, sens, and spec.

### Usage

```
comp_ppod(prev, sens, spec)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

### **Details**

comp\_ppod uses probabilities (not frequencies) as inputs and returns a proportion (probability) without rounding.

Definition: ppod is proportion (or probability) of positive decisions:

```
ppod = dec_pos/N = (hi + fa)/(hi + mi + fa + cr)
```

Values range from 0 (only negative decisions) to 1 (only positive decisions).

Importantly, positive decisions dec\_pos are not necessarily correct decisions dec\_cor.

# Value

The proportion of positive decisions ppod as a probability. A warning is provided for NaN values.

comp_pod(0, 0, 1) # => 0
comp_pod(0, 0, 0) # => 1
```

comp\_PPV

Compute a decision's positive predictive value (PPV) from probabilities.

# **Description**

comp\_PPV computes the positive predictive value PPV from 3 essential probabilities prev, sens, and spec.

# Usage

```
comp_PPV(prev, sens, spec)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

# **Details**

comp\_PPV uses probabilities (not frequencies) and does not round results.

comp\_prev 45

### Value

The positive predictive value PPV as a probability. A warning is provided for NaN values.

#### See Also

is_extreme_prob_set(prev = 1, sens = 0, spec = .5) # => verifies extreme cases

comp_PPV(prev = 0, sens = .5, spec = 1) # => NaN, only cr: hi = 0 and fa = 0: PPV = 0/0 = NaN
is_extreme_prob_set(prev = 0, sens = .5, spec = 1) # => verifies extreme cases

comp_PPV(prev = .5, sens = 0, spec = 1) # => NaN, only cr: hi = 0 and fa = 0: PPV = 0/0 = NaN
is_extreme_prob_set(prev = .5, sens = 0, spec = 1) # => verifies extreme cases
```

comp\_prev

Compute the condition's prevalence (baseline probability) from frequencies.

# **Description**

comp\_prev computes a condition's prevalence value prev (or baseline probability) from 4 essential frequencies (hi, mi, fa, cr).

# Usage

```
comp_prev(hi = freq$hi, mi = freq$mi, fa = freq$fa, cr = freq$cr)
```

46 comp\_prob

# **Arguments**

hi	The number of hits hi (or true positives).
mi	The number of misses mi (or false negatives).
fa	The number of false alarms fa (or false positives).
cr	The number of correct rejections cr (or true negatives).

#### **Details**

A condition's prevalence value prev is the probability of the condition being TRUE.

```
The probability prev can be computed from frequencies as the the ratio of cond_true (i.e., hi + mi) divided by N (i.e., hi + mi + fa + cr):

prev = cond_true/N = (hi + mi)/(hi + mi + fa + cr)
```

# See Also

num contains basic numeric parameters; init\_num initializes basic numeric parameters; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; is\_prob verifies probability inputs; is\_freq verifies frequency inputs.

comp\_prob

Compute probabilities from (3 essential) probabilities.

### **Description**

comp\_prob computes current probability information from 3 essential probabilities (prev, sens or mirt, spec or fart). It returns a list of 13 key probabilities prob as its output.

# Usage

```
comp_prob(
  prev = num$prev,
  sens = num$sens,
  mirt = NA,
  spec = num$spec,
  fart = NA,
  tol = 0.01
)
```

### **Arguments**

The condition's prevalence value prev (i.e., the probability of the condition be-

ing TRUE).

sens The decision's sensitivity value sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its

complement mirt is provided.

mir	t	The decision's miss rate value $\mbox{mirt}$ (i.e., the conditional probability of a negative decision provided that the condition is TRUE). $\mbox{mirt}$ is optional when its complement sens is provided.
spe	С	The decision's specificity value $spec$ (i.e., the conditional probability of a negative decision provided that the condition is FALSE). $spec$ is optional when its complement $fart$ is provided.
far	t	The decision's false alarm rate fart (i.e., the conditional probability of a pos-

itive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

47

A numeric tolerance value for is\_complement. Default: tol = .01. tol

### **Details**

comp\_prob

comp\_prob assumes that a sufficient and consistent set of essential probabilities (i.e., prev and either sens or its complement mirt, and either spec or its complement fart) is provided.

comp\_prob computes and returns a full set of basic and various derived probabilities (e.g., the probability of a positive decision ppod, the probability of a correct decision acc, the predictive values PPV and NPV, as well as their complements FDR and FOR) in its output of a list prob.

Extreme probabilities (sets containing two or more probabilities of 0 or 1) may yield unexpected values (e.g., predictive values PPV or NPV turning NaN when is\_extreme\_prob\_set evaluates to TRUE).

comp\_prob is the probability counterpart to the frequency function comp\_freq.

Key relationships between probabilities and frequencies:

• Three perspectives on a population:

A population of N individuals can be split into 2 subsets of frequencies in 3 different ways:

1. by condition:

```
N = cond_true + cond_false
```

The frequency cond\_true depends on the prevalence prev and the frequency cond\_false depends on the prevalence's complement 1 - prev.

2. by decision:

```
N = dec_pos + dec_neg
```

The frequency dec\_pos depends on the proportion of positive decisions ppod and the frequency dec\_neg depends on the proportion of negative decisions 1 - ppod.

3. by accuracy (i.e., correspondence of decision to condition):

```
N = dec_cor + dec_err
```

Each perspective combines 2 pairs of the 4 essential probabilities (hi, mi, fa, cr).

When providing probabilities, the population size N is a free parameter (independent of the essential probabilities prev, sens, and spec).

If N is unknown (NA), a suitable minimum value can be computed by comp\_min\_N.

• Defining probabilities in terms of frequencies:

Probabilities are – determine, describe, or are defined as – the relationships between frequencies. Thus, they can be computed as ratios between frequencies:

```
1. prevalence prev:
  prev = cond_true/N = (hi + mi) / (hi + mi + fa + cr)
```

48 comp\_prob

```
2. sensitivity sens:
    sens = hi/cond_true = hi / (hi + mi) = (1 - mirt)
 3. miss rate mirt:
    mirt = mi/cond_true = mi / (hi + mi) = (1 - sens)
 4. specificity spec:
    spec = cr/cond_false = cr / (fa + cr) = (1 - fart)
 5. false alarm rate fart:
    fart = fa/cond_false = fa / (fa + cr) = (1 - spec)
 6. proportion of positive decisions ppod:
    ppod = dec_pos/N = (hi + fa) / (hi + mi + fa + cr)
 7. positive predictive value PPV:
    PPV = hi/dec_pos = hi / (hi + fa) = (1 - FDR)
 8. negative predictive value NPV:
    NPV = cr/dec_neg = cr/(mi + cr) = (1 - FOR)
 9. false detection rate FDR:
    FDR = fa/dec_pos = fa/(hi + fa) = (1 - PPV)
10. false omission rate FOR:
    FOR = mi/dec_neg = mi/(mi + cr) = (1 - NPV)
11. accuracy acc:
    acc = dec_{cor}/N = (hi + cr) / (hi + mi + fa + cr)
12. rate of hits, given accuracy p_acc_hi:
    p_acc_hi = hi/dec_cor = (1 - cr/dec_cor)
13. rate of false alarms, given inaccuracy p_err_fa:
    p_err_fa = fa/dec_err = (1 - mi/dec_err)
```

Note: When frequencies are rounded (by round = TRUE in comp\_freq), probabilities computed from freq may differ from exact probabilities.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

```

comp\_prob\_freq

Compute probabilities from (4 essential) frequencies.

# Description

comp\_prob\_freq computes current probability information from 4 essential frequencies (hi, mi, fa, cr). It returns a list of 11 frequencies freq for a population of N individuals as its output.

50 comp\_prob\_freq

# Usage

```
comp_prob_freq(hi = freq$hi, mi = freq$mi, fa = freq$fa, cr = freq$cr)
```

### **Arguments**

```
hi The number of hits hi (or true positives).

mi The number of misses mi (or false negatives).

fa The number of false alarms fa (or false positives).

cr The number of correct rejections cr (or true negatives).
```

### **Details**

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

```

Other format conversion functions: comp\_freq\_freq(), comp\_freq\_prob(), comp\_prob\_prob()

# **Examples**

```
## Basics:
comp_prob_freq() # => computes prob from current freq

## Beware of rounding:
all.equal(prob, comp_prob_freq()) # => would be TRUE (IF freq were NOT rounded)!
fe <- comp_freq(round = FALSE) # compute exact freq (not rounded)
all.equal(prob, comp_prob_freq(fe$hi, fe$mi, fe$fa, fe$cr)) # is TRUE (qed).</pre>
```

comp\_prob\_prob 51

```
## Explain by circular chain (compute prob 1. from num and 2. from freq)
# 0. Inspect current numeric parameters:
num

# 1. Compute currently 11 probabilities in prob (from essential probabilities):
prob <- comp_prob()
prob

# 2. Compute currently 11 frequencies in freq (from essential probabilities):
freq <- comp_freq(round = FALSE)  # no rounding (to obtain same probabilities later)
freq

# 3. Compute currently 11 probabilities again (but now from frequencies):
prob_freq <- comp_prob_freq()
prob_freq

# 4. Check equality of probabilities (in steps 1. and 3.):
all.equal(prob, prob_freq)  # => should be TRUE!
```

comp\_prob\_prob

Compute probabilities from (3 essential) probabilities.

# **Description**

comp\_prob\_prob computes current probability information from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart). It returns a list of 13 key probabilities (prob) as its output.

# Usage

```
comp_prob_prob(
  prev = prob$prev,
  sens = prob$sens,
  mirt = NA,
  spec = prob$spec,
  fart = NA,
  tol = 0.01
)
```

# **Arguments**

prev

The condition's prevalence value prev (i.e., the probability of condition being TRUE).

·

sens

The decision's sensitivity value sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.

52 comp\_prob\_prob

mirt	The decision's miss rate value mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
tol	A numeric tolerance value for is_complement. Default: tol = .01.

#### **Details**

comp\_prob\_prob is a wrapper function for the more basic function comp\_prob.

Extreme probabilities (sets containing 2 or more probabilities of 0 or 1) may yield unexpected values (e.g., predictive values PPV or NPV turning NaN when is\_extreme\_prob\_set evaluates to TRUE).

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Functions translating between representational formats:

- 1. comp\_prob\_prob (defined here) is a wrapper function for comp\_prob and an analog to 3 other format conversion functions:
- 2. comp\_prob\_freq computes current *probability* information contained in prob from 4 essential frequencies (hi, mi, fa, cr).
- 3. comp\_freq\_prob computes current *frequency* information contained in freq from 3 essential probabilities (prev, sens, spec).
- 4. comp\_freq\_freq computes current *frequency* information contained in freq from 4 essential frequencies (hi, mi, fa, cr).

comp_prob_prob(1, 1, 1, 1) # only warning: is_complement not in tolerated range
```

comp\_sens

Compute a decision's sensitivity from its miss rate.

# **Description**

comp\_sens is a conversion function that takes a miss rate mirt – given as a probability (i.e., a numeric value in the range from 0 to 1) – as its input, and returns the corresponding sensitivity sens – also as a probability – as its output.

# Usage

```
comp_sens(mirt)
```

54 comp\_spec

# Arguments

mirt

The decision's miss rate mirt as a probability.

#### **Details**

The sensitivity sens and miss rate mirt are complements (sens = (1 - mirt)) and both features of the decision process (e.g., a diagnostic test).

The function comp\_sens is complementary to the conversion function comp\_mirt and uses the generic function comp\_complement.

#### Value

The decision's sensitivity sens as a probability.

# See Also

comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_spec()
```

# **Examples**

comp\_spec

Compute a decision's specificity from its false alarm rate.

# Description

comp\_spec is a conversion function that takes a false alarm rate fart – given as a probability (i.e., a numeric value in the range from 0 to 1) – as its input, and returns the corresponding specificity spec – also as a probability – as its output.

# Usage

```
comp_spec(fart)
```

# **Arguments**

fart

The decision's false alarm rate fart as a probability.

cond\_false 55

# **Details**

The specificity spec and the false alarm rate fart are complements (spec = (1 - fart)) and both features of the decision process (e.g., a diagnostic test).

The function comp\_spec is complementary to the conversion function comp\_fart and uses the generic function comp\_complement.

# Value

The decision's specificity spec as a probability.

### See Also

comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other functions computing probabilities: comp_FDR(), comp_FOR(), comp_NPV(), comp_PPV(), comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_comp_pair(), comp_complement(), comp_complete_prob_set(), comp_err(), comp_fart(), comp_mirt(), comp_ppod(), comp_prob_freq(), comp_prob(), comp_sens()
```

# Examples

cond\_false

Number of individuals for which the condition is false.

# **Description**

cond\_false is a frequency that describes the number of individuals in the current population N for which the condition is FALSE (i.e., actually false cases).

# Usage

```
cond_false
```

#### **Format**

An object of class numeric of length 1.

56 cond\_false

### **Details**

Key relationships:

1. to probabilities: The frequency of cond\_false individuals depends on the population size N and the complement of the condition's prevalence 1 - prev and is split further into two subsets of fa by the false alarm rate fart and cr by the specificity spec.

Perspectives:

(a) by condition:

```
The frequency cond_false is determined by the population size N times the complement of the prevalence (1 - prev): cond_false= N x (1 - prev)
```

(b) by decision:

```
a. The frequency fa is determined by cond_false times the false alarm rate fart = (1 - spec) (aka. FPR):
fa = cond_false x fart = cond_false x (1 - spec)
b. The frequency cr is determined by cond_false times the specificity spec = (1 - fart):
cr = cond_false x spec = cond_false x (1 - fart)
```

- 2. to other frequencies: In a population of size N the following relationships hold:
  - N = cond\_true + cond\_false (by condition)
  - N = dec\_pos + dec\_neg (by decision)
  - N = dec\_cor + dec\_err (by correspondence of decision to condition)
  - N = hi + mi + fa + cr (by condition x decision)

Current frequency information is computed by comp\_freq and contained in a list freq.

### References

is\_freq verifies frequencies; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information.

Other frequencies: N, cond\_true, cr, dec\_cor, dec\_err, dec\_neg, dec\_pos, fa, hi, mi

# **Examples**

```
cond_false <- 1000 * .90 # => sets cond_false to 90% of 1000 = 900 cases.
is_freq(cond_false) # => TRUE
is_prob(cond_false) # => FALSE, as cond_false is no probability [but (1 - prev) and spec are]
```

cond\_true 57

cond\_true

Number of individuals for which the condition is true.

# **Description**

cond\_true is a frequency that describes the number of individuals in the current population N for which the condition is TRUE (i.e., actually true cases).

# Usage

cond\_true

#### **Format**

An object of class numeric of length 1.

# **Details**

Key relationships:

 to probabilities: The frequency of cond\_true individuals depends on the population size N and the condition's prevalence prev and is split further into two subsets of hi by the sensitivity sens and mi by the miss rate mirt.

Perspectives:

(a) by condition:

The frequency cond\_true is determined by the population size N times the prevalence prev:

```
cond_true = N x prev
```

- (b) by decision:
  - a. The frequency hi is determined by cond\_true times the sensitivity sens (aka. hit rate HR):

```
hi = cond_true x sens
```

- b. The frequency mi is determined by cond\_true times the miss rate mirt = (1 sens): mi = cond\_true x mirt = cond\_true x (1 sens)
- 2. to other frequencies: In a population of size N the following relationships hold:
  - N = cond\_true + cond\_false (by condition)
  - N = dec\_pos + dec\_neg (by decision)
  - N = dec\_cor + dec\_err (by correspondence of decision to condition)
  - N = hi + mi + fa + cr (by condition x decision)

Current frequency information is computed by comp\_freq and contained in a list freq.

# References

```
cond_true <- 1000 * .10  # => sets cond_true to 10% of 1000 = 100 cases.
is_freq(cond_true)  # => TRUE
is_prob(cond_true)  # => FALSE, as cond_true is no probability (but prev and sens are)
```

cr

Frequency of correct rejections or true negatives (TN).

# **Description**

cr is the frequency of correct rejections or true negatives (TN) in a population of N individuals.

# Usage

cr

#### **Format**

An object of class numeric of length 1.

#### **Details**

Definition: cr is the frequency of individuals for which Condition = FALSE and Decision = FALSE (negative).

cr is a measure of correct classifications, not an individual case.

# Relationships:

- 1. to probabilities: The frequency cr depends on the specificity spec (aka. true negative rate, TNR) and is conditional on the prevalence prev.
- 2. to other frequencies: In a population of size N the following relationships hold:
  - N = cond\_true + cond\_false (by condition)
  - N = dec\_pos + dec\_neg (by decision)
  - N = dec\_cor + dec\_err (by correspondence of decision to condition)
  - N = hi + mi + fa + cr (by condition x decision)

dec\_cor 59

# See Also

spec is the specificity or correct rejection rate (aka. true negative rate TNR); num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information; is\_freq verifies frequencies.

Other essential parameters: fa, hi, mi, prev, sens, spec

Other frequencies: N, cond\_false, cond\_true, dec\_cor, dec\_err, dec\_neg, dec\_pos, fa, hi, mi

dec\_cor

Number of individuals for which the decision is correct.

# **Description**

dec\_cor is a frequency that describes the number of individuals in the current population N for which the decision is correct/accurate (i.e., cases in which the decision corresponds to the condition).

# Usage

dec\_cor

### **Format**

An object of class numeric of length 1.

### **Details**

Key relationships:

- 1. to probabilities: The frequency of dec\_cor individuals depends on the population size N and the accuracy acc.
- 2. to other frequencies: In a population of size N the following relationships hold:
  - N = cond\_true + cond\_false (by condition)
  - N = dec\_pos + dec\_neg (by decision)
  - N = dec\_cor + dec\_err (by correspondence of decision to condition)
  - dec\_cor = hi + cr
  - dec\_err = mi + fa
  - N = hi + mi + fa + cr (by condition x decision)
- 3. correspondence: When not rounding the frequencies of freq then

```
dec\_cor = N \times acc = hi + cr
```

(i.e., dec\_cor corresponds to the sum of true positives hi and true negatives cr.

Current frequency information is computed by comp\_freq and contained in a list freq.

dec\_err

# See Also

is\_freq verifies frequencies; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information.

Other frequencies: N, cond\_false, cond\_true, cr, dec\_err, dec\_neg, dec\_pos, fa, hi, mi

# **Examples**

```
dec_cor <- 1000 * .50  # => sets dec_cor to 50% of 1000 = 500 cases.
is_freq(dec_cor)  # => TRUE
is_prob(dec_cor)  # => FALSE, as dec_cor is no probability (but acc, bacc/wacc ARE)
```

dec\_err

Number of individuals for which the decision is erroneous.

# **Description**

dec\_err is a frequency that describes the number of individuals in the current population N for which the decision is incorrect or erroneous (i.e., cases in which the decision does not correspond to the condition).

# Usage

dec\_err

# **Format**

An object of class numeric of length 1.

#### **Details**

Key relationships:

- 1. to probabilities: The frequency of dec\_err individuals depends on the population size N and is equal to the sum of false negatives mi and false positives fa.
- 2. to other frequencies: In a population of size N the following relationships hold:

```
N = cond_true + cond_false (by condition)
N = dec_pos + dec_neg (by decision)
N = dec_cor + dec_err (by correspondence of decision to condition)
dec_cor = hi + cr
dec_err = mi + fa
N = hi + mi + fa + cr (by condition x decision)
```

Current frequency information is computed by comp\_freq and contained in a list freq.

dec\_neg 61

# References

Other frequencies: N, cond\_false, cond\_true, cr, dec\_cor, dec\_neg, dec\_pos, fa, hi, mi

# **Examples**

```
dec_err <- 1000 * .50  # => sets dec_err to 50% of 1000 = 500 cases.
is_freq(dec_err)  # => TRUE
is_prob(dec_err)  # => FALSE, as dec_err is no probability (but acc, bacc/wacc ARE)
```

dec\_neg

Number of individuals for which the decision is negative.

# Description

dec\_neg is a frequency that describes the number of individuals in the current population N for which the decision is negative (i.e., cases not called or not predicted).

#### Usage

dec\_neg

### **Format**

An object of class numeric of length 1.

### **Details**

Key relationships:

- to probabilities: The frequency of dec\_neg individuals depends on the population size N and the decision's proportion of negative decisions (1 - ppod) and is split further into two subsets of cr by the negative predictive value NPV and mi by the false omission rate FOR = 1 - NPV. Perspectives:
  - (a) by condition:

```
The frequency dec_neg is determined by the population size N times the proportion of negative decisions (1 - ppod):
```

```
dec_neg = N \times (1 - ppod)
```

62 dec\_pos

(b) by decision:

```
a. The frequency cr is determined by dec_neg times the negative predictive value NPV:
cr = dec_neg x NPV
b. The frequency mi is determined by dec_neg times the false omission rate FOR = (1 - NPV):
mi = dec_neg x FOR = dec_neg x (1 - NPV)
```

2. to other frequencies: In a population of size N the following relationships hold:

```
N = cond_true + cond_false (by condition)
N = dec_pos + dec_neg (by decision)
N = dec_cor + dec_err (by correspondence of decision to condition)
N = hi + mi + fa + cr (by condition x decision)
```

Current frequency information is computed by comp\_freq and contained in a list freq.

```

# **Examples**

```
dec_neg <- 1000 * .67  # => sets dec_neg to 67% of 1000 = 670 cases.
is_freq(dec_neg)  # => TRUE
is_prob(dec_neg)  # => FALSE, as dec_neg is no probability (but ppod, NPV and FOR are)
```

dec\_pos

Number of individuals for which the decision is positive.

# **Description**

dec\_pos is a frequency that describes the number of individuals in the current population N for which the decision is positive (i.e., called or predicted cases).

# Usage

dec\_pos

### Format

An object of class numeric of length 1.

dec\_pos 63

### **Details**

Key relationships:

 to probabilities: The frequency of dec\_pos individuals depends on the population size N and the decision's proportion of positive decisions ppod and is split further into two subsets of hi by the positive predictive value PPV and fa by the false detection rate FDR = 1 - PPV.
 Perspectives:

(a) by condition:

The frequency dec\_pos is determined by the population size N times the proportion of positive decisions ppod:

```
dec_pos = N x ppod
```

- (b) by decision:
  - a. The frequency hi is determined by dec\_pos times the positive predictive value PPV (aka. precision):

```
hi = dec_pos x PPV
```

b. The frequency fa is determined by  $dec_{pos}$  times the false detection rate FDR = (1 - PPV):

```
fa = dec_pos x FDR = dec_pos x (1 - PPV)
```

- 2. to other frequencies: In a population of size N the following relationships hold:
  - N = cond\_true + cond\_false (by condition)
  - N = dec\_pos + dec\_neg (by decision)
  - N = dec\_cor + dec\_err (by correspondence of decision to condition)
  - N = hi + mi + fa + cr (by condition x decision)

Current frequency information is computed by comp\_freq and contained in a list freq.

# **Examples**

64 err

df\_scenarios

A collection of riskyr scenarios from various sources (as df).

# **Description**

df\_scenarios is an R data frame that contains a collection of scenarios from the scientific literature and other sources.

# Usage

df\_scenarios

#### **Format**

A data frame with currently 25 rows (i.e., scenarios) and 21 columns (variables describing each scenario):

See scenarios for a list of scenarios and the variables currently contained in df\_scenarios.

Note that names of variables (columns) correspond to a subset of init\_txt (to initialize txt) and init\_num (to initialize num).

The variables scen\_src and scen\_apa provide a scenario's source information.

### **Details**

When loading riskyr, all scenarios contained in df\_scenarios are converted into a list of riskyr objects scenarios.

# See Also

scenarios contains all scenarios as riskyr objects; riskyr initializes a riskyr scenario; txt contains basic text information; init\_txt initializes text information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; pal contains current color information; init\_pal initializes color information.

Other datasets: BRCA1\_mam, BRCA1\_ova, BRCA1, BRCA2\_mam, BRCA2\_ova, BRCA2, t\_A, t\_B, t\_I

err

Error rate (err) as the probability of an incorrect decision.

### **Description**

err defines the error rate as the complement of accuracy acc or lack of correspondence of decisions to conditions.

# Usage

err

fa 65

### **Format**

An object of class numeric of length 1.

### **Details**

```
Definition:
err = (1 - acc)
When freq are not rounded (round = FALSE) then
err = dec_err/N = (mi + fa)/N
```

err is currently not included in prob, but shown in plots.

See err's complement of accuracy acc for computation and accu for current accuracy metrics and several possible interpretations of accuracy.

### See Also

acc provides overall accuracy; comp\_acc computes accuracy from probabilities; accu lists current accuracy metrics; comp\_accu\_prob computes exact accuracy metrics from probabilities; comp\_accu\_freq computes accuracy metrics from frequencies; comp\_sens and comp\_PPV compute related probabilities; is\_extreme\_prob\_set verifies extreme cases; comp\_complement computes a probability's complement; is\_complement verifies probability complements; comp\_prob computes current probability information; prob contains current probability information; is\_prob verifies probabilities.

```
Other probabilities: FDR, FOR, NPV, PPV, acc, fart, mirt, ppod, prev, sens, spec
Other metrics: accu, acc, comp_accu_freq(), comp_accu_prob(), comp_acc(), comp_err()
```

# **Examples**

```
err <- .50  # sets a rate of incorrect decisions of 50%
err <- 50/100  # (dec_err) for 50 out of 100 individuals
is_prob(err)  # TRUE</pre>
```

fa

Frequency of false alarms or false positives (FP).

# Description

fa is the frequency of false alarms or false positives (FP) in a population of N individuals.

# Usage

fa

# Format

An object of class numeric of length 1.

66 fart

### **Details**

Definition: fa is the frequency of individuals for which Condition = FALSE and Decision = TRUE (positive).

fa is a measure of incorrect classifications (type-I-errors), not an individual case.

# Relationships:

- 1. to probabilities: The frequency fa depends on the false alarm rate fart (aka. false positive rate, FPR) and is conditional on the prevalence prev.
- 2. to other frequencies: In a population of size N the following relationships hold:

```
• N = cond_true + cond_false (by condition)
```

- N = dec\_pos + dec\_neg (by decision)
- N = dec\_cor + dec\_err (by correspondence of decision to condition)
- N = hi + mi + fa + cr (by condition x decision)

# See Also

fart is the probability of false alarms (aka. false positive rate FPR or fallout); num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information; is\_freq verifies frequencies.

Other essential parameters: cr, hi, mi, prev, sens, spec

Other frequencies: N, cond\_false, cond\_true, cr, dec\_cor, dec\_err, dec\_neg, dec\_pos, hi, mi

fart

The false alarm rate (or false positive rate) of a decision process or diagnostic procedure.

# **Description**

fart defines a decision's false alarm rate (or the rate of false positives): The conditional probability of the decision being positive if the condition is FALSE.

# Usage

fart

#### **Format**

An object of class numeric of length 1.

fart 67

### **Details**

Understanding or obtaining the false alarm rate fart:

 Definition: fart is the conditional probability for an incorrect positive decision given that the condition is FALSE:

```
fart = p(decision = positive | condition = FALSE) or the probability of a false alarm.
```

- Perspective: fart further classifies the subset of cond\_false individuals by decision (fart = fa/cond\_false).
- Alternative names: false positive rate (FPR), rate of type-I errors (alpha), statistical significance level, fallout
- Relationships:

```
a. fart is the complement of the specificity spec:
```

```
fart = 1 - spec
```

b. fart is the opposite conditional probability – but not the complement – of the false discovery rate or false detection rate FDR:

```
FDR = p(condition = FALSE | decision = positive)
```

- In terms of frequencies, fart is the ratio of fa divided by cond\_false (i.e., fa + cr): fart = fa/cond\_false = fa/(fa + cr)
- Dependencies: fart is a feature of a decision process or diagnostic procedure and a measure of incorrect decisions (false positives).

However, due to being a conditional probability, the value of fart is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

# References

Consult Wikipedia for additional information.

### See Also

comp\_fart computes fart as the complement of spec prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

Other probabilities: FDR, FOR, NPV, PPV, acc, err, mirt, ppod, prev, sens, spec

# **Examples**

```
fart <- .25  # sets a false alarm rate of 25%
fart <- 25/100  # (decision = positive) for 25 out of 100 people with (condition = FALSE)
is_prob(fart)  # TRUE</pre>
```

FDR

**FDR** 

The false detection rate of a decision process or diagnostic procedure.

# **Description**

FDR defines a decision's false detection (or false discovery) rate (FDR): The conditional probability of the condition being FALSE provided that the decision is positive.

# Usage

**FDR** 

#### **Format**

An object of class numeric of length 1.

### **Details**

Understanding or obtaining the false detection fate or false discovery rate (FDR):

 Definition: FDR is the conditional probability for the condition being FALSE given a positive decision:

```
FDR = p(condition = FALSE | decision = positive)
```

- Perspective: FDR further classifies the subset of dec\_pos individuals by condition (FDR = fa/dec\_pos = fa/(hi + fa)).
- · Alternative names: false discovery rate
- Relationships:

a. FDR is the complement of the positive predictive value PPV:

```
FDR = 1 - PPV
```

b. FDR is the opposite conditional probability – but not the complement – of the false alarm rate fart:

```
fart = p(decision = positive | condition = FALSE)
```

- In terms of frequencies, FDR is the ratio of fa divided by dec\_pos (i.e., hi + fa): FDR = fa/dec\_pos = fa/(hi + fa)
- Dependencies: FDR is a feature of a decision process or diagnostic procedure and a measure of incorrect decisions (positive decisions that are actually FALSE).

However, due to being a conditional probability, the value of FDR is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

Other probabilities: FOR, NPV, PPV, acc, err, fart, mirt, ppod, prev, sens, spec

### **Examples**

```
FDR <- .45  # sets a false detection rate (FDR) of 45%  
FDR <- 45/100  # (condition = FALSE) for 45 out of 100 people with (decision = positive) is_prob(FDR)  # TRUE
```

FFTrees\_riskyr

Convert from FFTrees to riskyr objects.

### Description

FFTrees\_riskyr converts an FFTrees object — as generated by the **FFTrees** package — into a corresponding riskyr object.

# Usage

```
FFTrees_riskyr(x, data = "train", tree = 1)
```

### **Arguments**

x An FFTrees object (generated by **FFTrees**).

data The type of data to consider (as a character string). Must be either "train"

(for training/fitting data) or "test" (for test/prediction data). Default: data =

"train".

An integer specifying the tree to consider (as an integer). Default: tree = 1.

# **Details**

FFTrees\_riskyr essentially allows using **riskyr** functions to visualize a fast-and-frugal tree (FFT)'s performance information (as contained in a 2x2 matrix of frequency counts).

The R package **FFTrees** creates, visualizes, and evaluates fast-and-frugal trees (FFTs) for solving binary classification problems in an efficient and transparent fashion.

### Value

A riskyr scenario (as riskyr object).

70 FOR

### References

See https://CRAN.R-project.org/package=FFTrees or https://github.com/ndphillips/FFTrees for information on the R package **FFTrees**.

#### See Also

riskyr initializes a riskyr scenario.

FOR

The false omission rate (FOR) of a decision process or diagnostic procedure.

# **Description**

FOR defines a decision's false omission rate (FOR): The conditional probability of the condition being TRUE provided that the decision is negative.

# Usage

FOR

### **Format**

An object of class numeric of length 1.

### **Details**

Understanding or obtaining the false omission rate FOR:

• Definition: FOR is the so-called false omission rate: The conditional probability for the condition being TRUE given a negative decision:

```
FOR = p(condition = TRUE | decision = negative)
```

- Perspective: FOR further classifies the subset of dec\_neg individuals by condition (FOR = mi/dec\_neg = mi/(mi + cr)).
- Alternative names: none?
- · Relationships:

a. FOR is the complement of the negative predictive value NPV:

```
FOR = 1 - NPV
```

b. FOR is the opposite conditional probability – but not the complement – of the miss rate mirt (aka. false negative rate FDR):

```
mirt = p(decision = negative | condition = TRUE)
```

- In terms of frequencies, FOR is the ratio of mi divided by dec\_neg (i.e., mi + cr): NPV = mi/dec\_neg = mi/(mi + cr)
- Dependencies: FOR is a feature of a decision process or diagnostic procedure and a measure of incorrect decisions (negative decisions that are actually FALSE).

However, due to being a conditional probability, the value of FOR is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

freq 71

Other probabilities: FDR, NPV, PPV, acc, err, fart, mirt, ppod, prev, sens, spec

# **Examples**

```
FOR <- .05  # sets a false omission rate of 5%  
FOR <- 5/100  # (condition = TRUE) for 5 out of 100 people with (decision = negative) is_prob(FOR)  # TRUE
```

frea

List current frequency information.

# **Description**

freq is a list of named numeric variables containing 11 key frequencies (and their values):

### Usage

freq

### **Format**

An object of class list of length 11.

# **Details**

- 1. the population size N
- 2. the number of cases for which cond\_true
- 3. the number of cases for which cond\_false
- 4. the number of cases for which dec\_pos
- 5. the number of cases for which dec\_neg
- 6. the number of cases for which dec\_cor
- 7. the number of cases for which dec\_err
- 8. the number of true positives, or hits hi
- 9. the number of false negatives, or misses mi

72 hi

- 10. the number of false positives, or false alarms fa
- 11. the number of true negatives, or correct rejections cr

These frequencies are computed from basic parameters (contained in num) and computed by using comp\_freq.

The list freq is the frequency counterpart to the list containing probability information prob.

Natural frequencies are always expressed in relation to the current population of size N.

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

Visualizations of current frequency information are provided by plot\_prism and plot\_icons.

freq <- comp_freq() # initialize freq to default parameters
freq # show current values
length(freq) # 11 known frequencies
names(freq) # show names of known frequencies</pre>
```

hi

Frequency of hits or true positives (TP).

# **Description**

hi is the frequency of hits or true positives (TP) in a population of N individuals.

# Usage

hi

init\_num 73

#### **Format**

An object of class numeric of length 1.

#### **Details**

Definition: hi is the frequency of individuals for which Condition = TRUE and Decision = TRUE (positive).

hi is a measure of correct classifications, not an individual case.

Relationships:

- 1. to probabilities: The frequency hi depends on the sensitivity sens (aka. hit rate or true positive rate, TPR) and is conditional on the prevalence prev.
- 2. to other frequencies: In a population of size N the following relationships hold:

```
N = cond_true + cond_false (by condition)
N = dec_pos + dec_neg (by decision)
N = dec_cor + dec_err (by correspondence of decision to condition)
N = hi + mi + fa + cr (by condition x decision)
```

#### See Also

sens is the probability of hits or hit rate HR; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information; is\_freq verifies frequencies.

```
Other frequencies: N, cond_false, cond_true, cr, dec_cor, dec_err, dec_neg, dec_pos, fa, mi
Other essential parameters: cr, fa, mi, prev, sens, spec
```

init\_num

Initialize basic numeric variables.

## **Description**

init\_num initializes basic numeric variables to define num as a list of named elements containing four basic probabilities (prev, sens, spec, and fart) and one frequency parameter (the population size N).

## Usage

```
init_num(
  prev = num.def$prev,
  sens = num.def$sens,
  spec = num.def$spec,
  fart = num.def$fart,
  N = num.def$N
)
```

74 init\_num

## Arguments

prev	The condition's prevalence value prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity value sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when is complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
N	The population size N.

#### Details

If spec is provided, its complement fart is optional. If fart is provided, its complement spec is optional. If no N is provided, a suitable minimum value is computed by comp\_min\_N.

#### Value

A list containing a valid quadruple of probabilities (prev, sens, spec, and fart) and one frequency (population size N).

### See Also

num contains basic numeric parameters; pal contains current color settings; txt contains current text settings; freq contains current frequency information; comp\_freq computes frequencies from probabilities; prob contains current probability information; comp\_prob computes current probability information; is\_valid\_prob\_set verifies sets of probability inputs; is\_extreme\_prob\_set verifies sets of extreme probabilities; comp\_min\_N computes a suitable minimum population size N.

Other functions initializing scenario information: init\_pal(), init\_txt(), riskyr()

init\_pal 75

init\_pal

Initialize basic color information.

## **Description**

init\_pal initializes basic color information (i.e., all colors corresponding to functional roles in the current scenario and used throughout the **riskyr** package).

# Usage

```
init_pal(
 N_col = pal_def["N"],
  cond_true_col = pal_def["cond_true"],
  cond_false_col = pal_def["cond_false"],
  dec_pos_col = pal_def["dec_pos"],
 dec_neg_col = pal_def["dec_neg"],
 dec_cor_col = pal_def["dec_cor"],
 dec_err_col = pal_def["dec_err"],
 hi_col = pal_def["hi"],
 mi_col = pal_def["mi"],
 fa_col = pal_def["fa"],
 cr_col = pal_def["cr"],
 PPV_col = pal_def["ppv"],
 NPV_col = pal_def["npv"],
  txt_col = pal_def["txt"],
 bg_col = pal_def["bg"],
 brd_col = pal_def["brd"]
)
```

## **Arguments**

N_col	Color representing the <i>population</i> of N cases or individuals.
cond_true_col	Color representing cases of cond_true, for which the current condition is TRUE.
cond_false_col	Color representing cases of in cond_false, for which the current condition is FALSE.
dec_pos_col	Color representing cases of dec_pos, for which the current decision is positive.
dec_neg_col	Color representing cases in dec_neg, for which the current decision is negative.
dec_cor_col	Color representing cases of correct decisions dec_cor, for which the current decision is accurate.
dec_err_col	Color representing cases in erroneous decisions dec_err, for which the current decision is inaccurate.

76 init\_txt

hi_col	Color representing <i>hits</i> or true positives in hi (i.e., correct cases for which the current condition is TRUE and the decision is positive).
mi_col	Color representing <i>misses</i> or false negatives in mi (i.e., incorrect cases for which the current condition is TRUE but the decision is negative).
fa_col	Color representing <i>false alarms</i> or false positives in fa (i.e., incorrect cases for which the current condition is FALSE but the decision is positive).
cr_col	Color representing <i>correct rejections</i> or true negatives in cr (i.e., correct cases for which the current condition is FALSE and the decision is negative).
PPV_col	Color representing <i>positive predictive values</i> PPV (i.e., the conditional probability that the condition is TRUE, provided that the decision is positive).
NPV_col	Color representing <i>negative predictive values</i> NPV (i.e., the conditional probability that the condition is FALSE, provided that the decision is negative).
txt_col	Color used for text labels.
bg_col	Background color of plot (used to set par(bg = bg_col)).
brd_col	Color used for borders (e.g., around bars or boxes).

## **Details**

All color information of the current scenario is stored as named colors in a list pal. init\_pal allows changing colors by assigning new colors to existing names.

#### See Also

num contains basic numeric parameters; init\_num initializes basic numeric parameters; txt contains current text information; init\_txt initializes text information; pal contains current color information; init\_pal initializes color information; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information.

Other functions initializing scenario information: init\_num(), init\_txt(), riskyr()

## **Examples**

```
init_pal()  # => define and return a vector of current (default) colors
length(init_pal()) # => 15 named colors
pal <- init_pal(N_col = "steelblue4") # => change a color (stored in pal)
pal <- init_pal(brd_col = NA) # => remove a color
```

init\_txt

Initialize basic text elements.

## **Description**

init\_txt initializes basic text elements txt (i.e., all titles and labels corresponding to the current scenario) that are used throughout the riskyr package.

init\_txt 77

## Usage

```
init_txt(
  scen_lbl = txt_lbl_def$scen_lbl,
  scen_txt = txt_lbl_def$scen_txt,
  scen_src = txt_lbl_def$scen_src,
  scen_apa = txt_lbl_def$scen_apa,
  scen_lng = txt_lbl_def$scen_lng,
  popu_lbl = txt_lbl_def$popu_lbl,
 N_{lbl} = txt_{lbl_def}N_{lbl}
  cond_lbl = txt_lbl_def$cond_lbl,

)
```

## **Arguments**

scen_lbl	The current scenario title (sometimes in Title Caps).
scen_txt	A longer text description of the current scenario (which may extend over several lines).
scen_src	The source information for the current scenario.
scen_apa	Source information in APA format.
scen_lng	Language of the current scenario (as character code). Options: "en": English, "de": German.
popu_lbl	A general name describing the current <i>population</i> .
N_lbl	A brief label for the current population popu or sample.
cond_lbl	A general name for the <i>condition</i> dimension currently considered (e.g., some clinical condition).
cond_true_lbl	A short label for the <i>presence</i> of the current condition or cond_true cases (the condition's true state of TRUE).
cond_false_lbl	A short label for the <i>absence</i> of the current condition or cond_false cases (the condition's true state of FALSE).
dec_lbl	A general name for the <i>decision</i> dimension (e.g., some diagnostic test) currently made.

78 init\_txt

dec_pos_lbl	A short label for <i>positive</i> decisions or dec_pos cases (e.g., predicting the presence of the condition).
dec_neg_lbl	A short label for <i>negative</i> decisions or dec_neg cases (e.g., predicting the absence of the condition).
acc_lbl	A general name for the <i>accuracy</i> dimension (e.g., correspondence of decision to condition).
dec_cor_lbl	A short label for <i>correct</i> decisions or dec_cor cases (e.g., accurately predicting the condition).
dec_err_lbl	A short label for <i>erroneous</i> decisions or dec_err cases (e.g., inaccurately predicting the condition).
sdt_lbl	A name for the case/category/cell dimension in the 2x2 contingency table (SDT: condition x decision).
hi_lbl	A short label for <i>hits</i> or <i>true positives</i> hi (i.e., correct decisions of the presence of the condition, when the condition is actually present).
mi_lbl	A short label for <i>misses</i> or <i>false negatives</i> mi (i.e., incorrect decisions of the absence of the condition when the condition is actually present).
fa_lbl	A short label for <i>false alarms</i> or <i>false positives</i> fa (i.e., incorrect decisions of the presence of the condition when the condition is actually absent).
cr_lbl	A short label for <i>correct rejections</i> or <i>true negatives</i> cr (i.e., a correct decision of the absence of the condition, when the condition is actually absent).

## **Details**

All textual elements that specify titles and details of the current scenario are stored as named elements (of type character) in a list txt. init\_txt allows changing elements by assigning new character objects to existing names.

However, you can directly specify scenario-specific text elements when defining a scenario with the riskyr function.

# See Also

```
txt for current text settings; pal for current color settings; num for basic numeric parameters.
Other functions initializing scenario information: init_num(), init_pal(), riskyr()
```

is\_complement 79

is_complement	Verify that two numbers are complements.	

#### **Description**

is\_complement is a function that takes 2 numeric arguments (typically probabilities) as inputs and verifies that they are *complements* (i.e., add up to 1, within some tolerance range tol).

## Usage

```
is\_complement(p1, p2, tol = 0.01)
```

## **Arguments**

p1	A numeric argument (typically probability in range from 0 to 1).
p2	A numeric argument (typically probability in range from 0 to 1).
tol	A numeric tolerance value. Default: tol = .01.

#### **Details**

Both p1 and p2 are necessary arguments. If one or both arguments are NA, is\_complement returns NA (i.e., neither TRUE nor FALSE).

The argument tol is optional (with a default value of .01) Numeric near-complements that differ by less than this value are still considered to be complements.

This function does not verify the type, range, or sufficiency of the inputs provided. See is\_prob and is\_suff\_prob\_set for this purpose.

## Value

NA or a Boolean value: NA if one or both arguments are NA; TRUE if both arguments are provided and complements (in tol range); otherwise FALSE.

## See Also

comp\_complement computes a probability's complement; comp\_comp\_pair computes pairs of complements; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; is\_valid\_prob\_set verifies the validity of probability inputs; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```

80 is\_extreme\_prob\_set

## **Examples**

```
# Basics:
is_complement(0, 1)
                        # => TRUE
is_complement(1/3, 2/3)
                        # => TRUE
# watch out for:
is_complement(NA, NA)
                            # => NA (but not FALSE)
is_complement(1, NA)
                            # => NA (but not FALSE)
is_complement(2, -1)
                            # => TRUE + warnings (p1 and p2 beyond range)
is_complement(8, -7)
                            # => TRUE + warnings (p1 and p2 beyond range)
is_complement(.3, .6)
                            # => FALSE + warning (beyond tolerance)
is_complement(.3, .6, tol = .1) # => TRUE (due to increased tolerance)
# ways to fail:
# is_complement(0, 0)
                             # => FALSE + warning (beyond tolerance)
# is_complement(1, 1)
                             # => FALSE + warning (beyond tolerance)
# is_complement(8, 8)
                             # => FALSE + warning (beyond tolerance)
```

is\_extreme\_prob\_set

Verify that a set of probabilities describes an extreme case.

## **Description**

is\_extreme\_prob\_set verifies that a set of probabilities (i.e., prev, and sens or mirt, and spec or fart) describe an extreme case.

## Usage

```
is_extreme_prob_set(prev, sens = NA, mirt = NA, spec = NA, fart = NA)
```

# Arguments

prev	The condition's prevalence value prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when is complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when is complement sens is provided.
spec	The decision's specificity spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when is complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

is\_extreme\_prob\_set 81

#### **Details**

If TRUE, a warning message describing the nature of the extreme case is printed to allow anticipating peculiar effects (e.g., that PPV or NPV values cannot be computed or are NaN).

This function does not verify the type, range, sufficiency, or consistency of its arguments. See is\_prob, is\_suff\_prob\_set, is\_complement, is\_valid\_prob\_pair and is\_valid\_prob\_set for these purposes.

#### Value

A Boolean value: TRUE if an extreme case is identified; otherwise FALSE.

#### See Also

is\_valid\_prob\_pair verifies that a pair of probabilities can be complements; is\_valid\_prob\_set verifies the validity of a set of probability inputs; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability

plot_tree(prev, 1, NA, 0, NA, N = 650)  # => illustrates this case
```

is\_freq

Verify that input is a frequency (positive integer value).

# **Description**

is\_freq is a function that checks whether its single argument freq is a frequency (i.e., a positive numeric integer value).

## Usage

```
is_freq(freq)
```

#### **Arguments**

freq

A single (typically numeric) argument.

# Value

A Boolean value: TRUE if freq is a frequency (positive integer), otherwise FALSE.

### See Also

num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; is\_valid\_prob\_set verifies the validity of probability inputs; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```
Other verification functions: is_complement(), is_extreme_prob_set(), is_integer(), is_matrix(), is_perc(), is_prob(), is_suff_prob_set(), is_valid_prob_pair(), is_valid_prob_set(), is_valid_prob_triple()
```

```
# ways to succeed:
is_freq(2)  # => TRUE, but does NOT return the frequency 2.
is_freq(0:3)  # => TRUE (for vector)

## ways to fail:
# is_freq(-1)  # => FALSE + warning (negative values)
```

is\_integer 83

```
# is_freq(1:-1)  # => FALSE (for vector) + warning (negative values)
# is_freq(c(1, 1.5, 2)) # => FALSE (for vector) + warning (non-integer values)
## note:
# is.integer(2) # => FALSE!
```

is\_integer

*Test for inters (i.e., whole numbers).* 

# Description

is\_integer tests if x contains *only* integer numbers.

## Usage

```
is_integer(x, tol = .Machine$double.eps^0.5)
```

#### **Arguments**

x Number(s) to test (required, accepts numeric vectors).

Numeric tolerance value. Default: tol = .Machine\$double.eps^0.5 (see ?.Machine for details).

#### **Details**

Thus, is\_integer does what the **base** R function is.integer is *not* designed to do:

- is\_integer() returns TRUE or FALSE depending on whether its numeric argument x is an integer value (i.e., a "whole" number).
- is.integer() returns TRUE or FALSE depending on whether its argument is of type "integer", and FALSE if its argument is a factor.

See the documentation of is.integer for definition and details.

## See Also

```
is.integer function of the R base package.
```

```
Other verification functions: is_complement(), is_extreme_prob_set(), is_freq(), is_matrix(), is_perc(), is_prob(), is_suff_prob_set(), is_valid_prob_pair(), is_valid_prob_set(), is_valid_prob_triple()
```

is\_matrix

## **Examples**

```
is_integer(2) # TRUE
is_integer(2/1) # TRUE
is_integer(2/3) # FALSE
x <- seq(1, 2, by = 0.5)
is_integer(x)

# Note contrast to base R:
is.integer(2/1) # FALSE!

# Compare:
is.integer(1 + 2)
is_integer(1 + 2)</pre>
```

is\_matrix

Verify a 2x2 matrix as a numeric contingency table.

## **Description**

is\_matrix verifies that mx is a valid 2x2 matrix (i.e., a numeric contingency table).

## Usage

```
is_matrix(mx)
```

## **Arguments**

mx

An object to verify (required).

#### **Details**

```
is_matrix is more restrictive than is.matrix, as it also requires that mx is.numeric, is.table, nrows(mx) == 2, and ncols(mx) == 2.
```

### Value

A Boolean value: TRUE if mx is a numeric matrix and 2x2 contingency table; otherwise FALSE.

is_matrix(matrix("A"))
is_matrix(matrix(1:4))
is_matrix(as.table(matrix(1:4, nrow = 1, ncol = 4)))
is_matrix(as.table(matrix(1:4, nrow = 4, ncol = 1)))
is_matrix(as.table(matrix(1:4, nrow = 2, ncol = 2)))
```

is\_perc

Verify that input is a percentage (numeric value from 0 to 100).

## **Description**

is\_perc is a function that checks whether its single argument perc is a percentage (proportion, i.e., a numeric value in the range from 0 to 100).

## Usage

```
is_perc(perc)
```

## **Arguments**

perc

A single (typically numeric) argument.

### Value

A Boolean value: TRUE if perc is a percentage (proportion), otherwise FALSE.

# is_perc(101) # => FALSE + warning (beyond range)
```

is\_prob

*Verify that input is a probability (numeric value from 0 to 1).* 

# Description

is\_prob is a function that checks whether its argument prob (a scalar or a vector) is a probability (i.e., a numeric value in the range from 0 to 1).

## Usage

```
is_prob(prob, NA_warn = FALSE)
```

## **Arguments**

prob A numeric argument (scalar or vector) that is to be checked.

NA\_warn Boolean value determining whether a warning is shown for NA values. Default:

NA\_warn = FALSE.

## Value

A Boolean value: TRUE if prob is a probability, otherwise FALSE.

## See Also

# is_prob(c(.5, 8), NA_warn = TRUE) # => FALSE + warning (outside range vector element)
# is_prob("Laplace", NA_warn = TRUE) # => FALSE + warning (non-numeric values)
```

is\_suff\_prob\_set

Verify a sufficient set of probability inputs.

## **Description**

is\_suff\_prob\_set is a function that takes 3 to 5 probabilities as inputs and verifies that they are sufficient to compute all derived probabilities and combined frequencies for a population of N individuals.

#### Usage

```
is_suff_prob_set(prev, sens = NA, mirt = NA, spec = NA, fart = NA)
```

# Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

88 is\_suff\_prob\_set

#### **Details**

While no alternative input option for frequencies is provided, specification of the essential probability prev is always necessary.

However, for 2 other essential probabilities there is a choice:

- 1. either sens or mirt is necessary (as both are complements).
- 2. either spec or fart is necessary (as both are complements).

is\_suff\_prob\_set does not verify the type, range, or consistency of its arguments. See is\_prob and is\_complement for this purpose.

#### Value

A Boolean value: TRUE if the probabilities provided are sufficient, otherwise FALSE.

#### See Also

num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; is\_valid\_prob\_set verifies the validity of probability inputs; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```
Other verification functions: is_complement(), is_extreme_prob_set(), is_freq(), is_integer(), is_matrix(), is_perc(), is_prob(), is_valid_prob_pair(), is_valid_prob_set(), is_valid_prob_triple()
```

```
# ways to work:
is_suff_prob_set(prev = 1, sens = 1, spec = 1) # => TRUE
is_suff_prob_set(prev = 1, mirt = 1, spec = 1) # => TRUE
is_suff_prob_set(prev = 1, sens = 1, fart = 1) # => TRUE
is_suff_prob_set(prev = 1, mirt = 1, fart = 1) # => TRUE

# watch out for:
is_suff_prob_set(prev = 1, sens = 2, spec = 3) # => TRUE, but is_prob is FALSE
is_suff_prob_set(prev = 1, mirt = 2, fart = 4) # => TRUE, but is_prob is FALSE
is_suff_prob_set(prev = 1, sens = 2, spec = 3, fart = 4) # => TRUE, but is_prob is FALSE

## ways to fail:
# is_suff_prob_set() # => FALSE + warning (prev missing)
# is_suff_prob_set(prev = 1) # => FALSE + warning (sens or mirt missing)
# is_suff_prob_set(prev = 1, sens = 1) # => FALSE + warning (spec or fart missing)
```

is\_valid\_prob\_pair 89

is_valid_prob_pair	Verify that a pair of probability inputs can be a pair of complementary probabilities.

## **Description**

is\_valid\_prob\_pair is a function that verifies that a pair of 2 numeric inputs p1 and p2 can be interpreted as a valid pair of probabilities.

## Usage

```
is_valid_prob_pair(p1, p2, tol = 0.01)
```

# **Arguments**

p1	A numeric argument (typically probability in range from 0 to 1).
p2	A numeric argument (typically probability in range from 0 to 1).
tol	A numeric tolerance value.

### **Details**

is\_valid\_prob\_pair is a wrapper function that combines is\_prob and is\_complement in one function.

Either p1 or p2 must be a probability (verified via is\_prob). If both arguments are provided they must be probabilities and complements (verified via is\_complement).

The argument to 1 is optional (with a default value of .01) Numeric near-complements that differ by less than this value are still considered to be complements.

## Value

A Boolean value: TRUE if exactly one argument is a probability, if both arguments are probabilities and complements, otherwise FALSE.

### See Also

is\_valid\_prob\_set uses this function to verify sets of probability inputs; is\_complement verifies numeric complements; is\_prob verifies probabilities; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```

```

90 is\_valid\_prob\_set

## **Examples**

```
# ways to succeed:
is_valid_prob_pair(1, 0)  # => TRUE
is_valid_prob_pair(0, 1)  # => TRUE
is_valid_prob_pair(1, NA)  # => TRUE + warning (NA)
is_valid_prob_pair(NA, 1)  # => TRUE + warning (NA)
is_valid_prob_pair(.50, .51)  # => TRUE (as within tol)

# ways to fail:
is_valid_prob_pair(.50, .52)  # => FALSE (as beyond tol)
is_valid_prob_pair(1, 2)  # => FALSE + warning (beyond range)
is_valid_prob_pair(NA, NA)  # => FALSE + warning (NA)
```

is\_valid\_prob\_set

Verify that a set of probability inputs is valid.

# Description

is\_valid\_prob\_set is a function that verifies that a set of (3 to 5) numeric inputs can be interpreted as a valid set of (3 essential and 2 optional) probabilities.

## Usage

```
is_valid_prob_set(prev, sens = NA, mirt = NA, spec = NA, fart = NA, tol = 0.01)
```

# Arguments

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
tol	A numeric tolerance value used by is_complement.

is\_valid\_prob\_set 91

#### **Details**

is\_valid\_prob\_set is a wrapper function that combines is\_prob, is\_suff\_prob\_set, and is\_complement in one function.

While no alternative input option for frequencies is provided, specification of the essential probability prev is always necessary. However, for 2 other essential probabilities there is a choice:

- 1. Either sens or mirt is necessary (as both are complements).
- 2. Either spec or fart is necessary (as both are complements).

The argument tol is optional (with a default value of .01) and used as the tolerance value of is\_complement.

is\_valid\_prob\_set verifies the validity of inputs, but does not compute or return numeric variables. Use is\_extreme\_prob\_set to verify sets of probabilities that describe extreme cases and init\_num for initializing basic parameters.

#### Value

A Boolean value: TRUE if the probabilities provided are valid; otherwise FALSE.

#### See Also

is\_valid\_prob\_pair verifies that probability pairs are complements; is\_prob verifies probabilities; prob contains current probability information; num contains basic numeric variables; init\_num initializes basic numeric variables; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```

                                  # => TRUE, but NO warning about extreme case!
is_valid_prob_set(1, 1, 0, NA, 0)
# ways to fail:
is_valid_prob_set(8, 1, 0, 1, 0)
                                  # => FALSE + warning (is_prob fails)
is_valid_prob_set(1, 1, 8, 1, 0) # => FALSE + warning (is_prob fails)
```

92 is\_valid\_prob\_triple

```
is_valid_prob_set(2, 1, 3, 1, 4)  # => FALSE + warning (is_prob fails)
is_valid_prob_set(1, .8, .2, .7, .2)  # => FALSE + warning (beyond complement range)
is_valid_prob_set(1, .8, .3, .7, .3)  # => FALSE + warning (beyond complement range)
is_valid_prob_set(1, 1, 1, 1, 1)  # => FALSE + warning (beyond complement range)
is_valid_prob_set(1, 1, 0, 1, 1)  # => FALSE + warning (beyond complement range)
```

## **Description**

is\_valid\_prob\_triple is a **deprecated** function that verifies that a set of 3 numeric inputs can be interpreted as a valid set of 3 probabilities.

## Usage

```
is_valid_prob_triple(prev, sens, spec)
```

### **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).

## Details

is\_valid\_prob\_triple is a simplified version of is\_valid\_prob\_set. It is a quick wrapper function that only verifies is\_prob for all of its 3 arguments.

is\_valid\_prob\_triple does not compute or return numeric variables. Use is\_extreme\_prob\_set to verify extreme cases and comp\_complete\_prob\_set to complete sets of valid probabilities.

#### Value

A Boolean value: TRUE if the probabilities provided are valid; otherwise FALSE.

### See Also

is\_extreme\_prob\_set verifies extreme cases; is\_valid\_prob\_set verifies sets of probability inputs; is\_valid\_prob\_pair verifies that probability pairs are complements; num contains basic numeric variables; init\_num initializes basic numeric variables; prob contains current probability information; comp\_prob computes current probability information; freq contains current frequency information; comp\_freq computes current frequency information; as\_pc displays a probability as a percentage; as\_pb displays a percentage as probability.

```

mi 93

## **Examples**

```
# ways to work:
is_valid_prob_triple(0, 0, 0)  # => TRUE
is_valid_prob_triple(1, 1, 1)  # => TRUE
## ways to fail:
# is_valid_prob_triple(0, 0)  # => ERROR (as no triple)
# is_valid_prob_triple(0, 0, 7)  # => FALSE + warning (beyond range)
# is_valid_prob_triple(0, NA, 0)  # => FALSE + warning (NA)
# is_valid_prob_triple("p", 0, 0)  # => FALSE + warning (non-numeric)
```

mi

Frequency of misses or false negatives (FN).

## **Description**

mi is the frequency of misses or false negatives (FN) in a population of N individuals.

#### Usage

mi

## **Format**

An object of class numeric of length 1.

## **Details**

Definition: mi is the frequency of individuals for which Condition = TRUE and Decision = FALSE (negative).

mi is a measure of incorrect classifications (type-II errors), not an individual case.

## Relationships:

- 1. to probabilities: The frequency mi depends on the miss rate mirt (aka. false negative rate, FNR) and is conditional on the prevalence prev.
- 2. to other frequencies: In a population of size  $\mbox{\it N}$  the following relationships hold:

```
• N = cond_true + cond_false (by condition)
```

- N = dec\_pos + dec\_neg (by decision)
- N = dec\_cor + dec\_err (by correspondence of decision to condition)
- N = hi + mi + fa + cr (by condition x decision)

94 mirt

#### See Also

mirt is the probability or rate of misses; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information; is\_freq verifies frequencies.

Other essential parameters: cr, fa, hi, prev, sens, spec

Other frequencies: N, cond\_false, cond\_true, cr, dec\_cor, dec\_err, dec\_neg, dec\_pos, fa, hi

mirt

The miss rate of a decision process or diagnostic procedure.

## **Description**

mirt defines a decision's miss rate value: The conditional probability of the decision being negative if the condition is TRUE.

## Usage

mirt

#### **Format**

An object of class numeric of length 1.

#### **Details**

Understanding or obtaining the miss rate mirt:

 Definition: sens is the conditional probability for an incorrect negative decision given that the condition is TRUE:

```
mirt = p(decision = negative | condition = TRUE)
or the probability of failing to detect true cases (condition = TRUE).
```

- Perspective: mirt further classifies the subset of cond\_true individuals by decision (mirt = mi/cond\_true).
- Alternative names: false negative rate (FNR), rate of type-II errors (beta)
- Relationships:

```
a. mirt is the complement of the sensitivity sens (aka. hit rate HR): mirt = (1 - sens) = (1 - HR)
```

b. mirt is the \_opposite\_ conditional probability – but not the complement – of the false omission rate FOR:

```
FOR = p(condition = TRUE | decision = negative)
```

- In terms of frequencies, mirt is the ratio of mi divided by cond\_true (i.e., hi + mi): mirt = mi/cond\_true = mi/(hi + mi)
- Dependencies: mirt is a feature of a decision process or diagnostic procedure and a measure of incorrect decisions (false negatives).

However, due to being a conditional probability, the value of mirt is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

N 95

#### References

Consult Wikipedia for additional information.

#### See Also

comp\_mirt computes mirt as the complement of sens; prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

Other probabilities: FDR, FOR, NPV, PPV, acc, err, fart, ppod, prev, sens, spec

## **Examples**

```
mirt <- .15  # => sets a miss rate of 15%
mirt <- 15/100  # => (decision = negative) for 15 out of 100 people with (condition = TRUE)
```

Ν

Number of individuals in the population.

## **Description**

N is a frequency that describes the number of individuals in the current population (i.e., the overall number of cases considered).

# Usage

Ν

### **Format**

An object of class numeric of length 1.

# **Details**

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Current frequency information is computed by comp\_freq and contained in a list freq.

## References

Consult Wikipedia: Statistical population for additional information.

96 NPV

## See Also

is\_freq verifies frequencies; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information.

Other frequencies: cond\_false, cond\_true, cr, dec\_cor, dec\_err, dec\_neg, dec\_pos, fa, hi, mi

## **Examples**

```
N <- 1000  # => sets a population size of 1000 is_freq(N)  # => TRUE is_prob(N)  # => FALSE (as N is no probability)
```

NPV

The negative predictive value of a decision process or diagnostic procedure.

## Description

NPV defines some decision's negative predictive value (NPV): The conditional probability of the condition being FALSE provided that the decision is negative.

#### Usage

NPV

#### **Format**

An object of class numeric of length 1.

#### **Details**

Understanding or obtaining the negative predictive value NPV:

• Definition: NPV is the conditional probability for the condition being FALSE given a negative decision:

```
NPV = p(condition = FALSE | decision = negative) or the probability of a negative decision being correct.
```

- Perspective: NPV further classifies the subset of dec\_neg individuals by condition (NPV = cr/dec\_neg = cr/(mi + cr)).
- Alternative names: true omission rate
- Relationships:

```
a. NPV is the complement of the false omission rate FOR:
```

```
NPV = 1 - FOR
```

b. NPV is the opposite conditional probability – but not the complement – of the specificity spec:

```
spec = p(decision = negative | condition = FALSE)
```

num 97

```
    In terms of frequencies, NPV is the ratio of cr divided by dec_neg (i.e., cr + mi):
    NPV = cr/dec_neg = cr/(cr + mi)
```

• Dependencies: NPV is a feature of a decision process or diagnostic procedure and – similar to the specificity spec – a measure of correct decisions (negative decisions that are actually FALSE).

However, due to being a conditional probability, the value of NPV is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

## References

Consult Wikipedia for additional information.

#### See Also

comp\_NPV computes NPV; prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

Other probabilities: FDR, FOR, PPV, acc, err, fart, mirt, ppod, prev, sens, spec

## **Examples**

```
NPV <- .95  # sets a negative predictive value of 95%   
NPV <- 95/100  # (condition = FALSE) for 95 out of 100 people with (decision = negative) is_prob(NPV)  # TRUE
```

num

List current values of basic numeric variables.

## **Description**

num is a list of named numeric variables containing 4 basic probabilities (prev, sens, spec, and fart) and 1 frequency parameter (the population size N).

## Usage

num

#### **Format**

An object of class list of length 5.

98 pal

## See Also

init\_num initializes basic numeric parameters; txt contains current text information; init\_txt initializes text information; pal contains current color information; init\_pal initializes color information; freq contains current frequency information; comp\_freq computes current frequency information; prob contains current probability information; comp\_prob computes current probability information.

Other lists containing current scenario information: accu, freq, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_unikn, pal\_vir, pal, prob, txt\_TF, txt\_org, txt

## **Examples**

```
num <- init_num() # => initialize num to default parameters
num # => show defaults
length(num) # => 5
```

pal

List current values of scenario color palette.

## Description

pal is initialized to a vector of named elements (colors) to define the scenario color scheme that is used throughout the **riskyr** package.

## Usage

pal

## Format

An object of class character of length 16.

#### **Details**

All color information corresponding to the current scenario is stored as named colors in a vector pal. To change a color, assign a new color to an existing element name.

pal currently contains colors with the following names:

- 1. N Color representing the *population* of N cases or individuals.
- 2. cond\_true Color representing cases of cond\_true, for which the current condition is TRUE.
- cond\_false Color representing cases of in cond\_false, for which the current condition is FALSE.
- 4. dec\_pos Color representing cases of dec\_pos, for which the current decision is positive.
- 5. dec\_neg Color representing cases in dec\_neg, for which the current decision is negative.
- 6. dec\_cor Color representing cases of correct decisions dec\_cor, for which the current decision is accurate.

pal 99

dec\_err Color representing cases of erroneous decisions dec\_err, for which the current decision is inaccurate.

- 8. hi Color representing *hits* or true positives in hi (i.e., correct cases for which the current condition is TRUE and the decision is positive).
- 9. mi Color representing *misses* or false negatives in mi (i.e., incorrect cases for which the current condition is TRUE but the decision is negative).
- 10. fa Color representing *false alarms* or false positives in fa (i.e., incorrect cases for which the current condition is FALSE but the decision is positive).
- 11. cr Color representing *correct rejections* or true negatives in cr (i.e., correct cases for which the current condition is FALSE and the decision is negative).
- 12. ppv Color representing *positive predictive values* PPV (i.e., the conditional probability that the condition is TRUE, provided that the decision is positive).
- 13. npv Color representing *negative predictive values* NPV (i.e., the conditional probability that the condition is FALSE, provided that the decision is negative).
- 14. txt Color used for text labels.
- 15. brd Color used for borders.
- 16. bg Color used for plot background (used to set par(bg = bg\_col)).

Note that color names for frequencies correspond to frequency names, but are different for probabilities (which are written in lowercase and only PPV and NPV have assigned colors).

pal["hi"] # shows the current color for hits (true positives, TP)
pal["hi"] <- "gold" # defines a new color for hits (true positives, TP)</pre>
```

100 pal\_bw

pal\_bw

Alternative color palette for black-and-white (greyscale) graphs.

## **Description**

pal\_bw is initialized to a vector of named elements (colors) to define an alternative (black-and-white, b/w) scenario color scheme.

## Usage

```
pal_bw
```

#### **Format**

An object of class character of length 16.

#### **Details**

Note that pal\_bw uses various shades of grey for frequency boxes so that their bounds remain visible on a white background when  $f_1wd = 0$  (as per default for most graphs).

See pal\_bwp for a stricter version that enforces black text and lines on white boxes (e.g., for printing purposes).

See pal for default color information.

Assign pal <- pal\_bw to use as default color scheme throughout the **riskyr** package.

## See Also

```
pal contains current color information; init_pal initializes color information.

```

pal\_bwp

pal_bwp Alternative color palette for black-and-white poses).	graphs (for printing pur-
---	---------------------------

### Description

pal\_bwp is initialized to a vector of named elements (colors) to define a strict (black-and-white, b/w) scenario color scheme that is suited for printing graphs in black-and-white.

## Usage

```
pal_bwp
```

## **Format**

An object of class character of length 16.

#### **Details**

pal\_bwp is a stricter version of the greyscale palette pal\_bw that enforces black text and lines on white boxes. Thus, the bounds of frequency boxes are invisible on white backgrounds unless the default of  $f_lwd = 0$  is changed (e.g., to  $f_lwd = 1$ ).

Some background colors (of frequencies) are also used as foreground colors (of probabilities, e.g., in plot\_curve and plot\_plane). For this reason, the plotting functions detect and adjust colors and/or line settings when pal\_bwp is used.

See pal\_bw for a more permissible black-and-white palette that uses various shades of grey for frequency boxes so that their bounds remain visible on a white background when  $f_1wd = 0$  (as per default for most graphs).

See pal for default color information.

Assign pal <- pal\_bwp to use as default color scheme throughout the **riskyr** package.

#### See Also

```
pal contains current color information; init_pal initializes color information.
```

```
pal_bwp  # shows all color names and current values
pal_bwp["hi"]  # shows the current color for hits (true positives, TP)
pal_bwp["hi"] <- "gold"  # defines a new color for hits (true positives, TP)</pre>
```

102 pal\_crisk

pal\_crisk

Color palette for cumulative risk curve.

# Description

pal\_crisk defines a default color palette for the plot\_crisk function (as a named vector).

## Usage

```
pal_crisk
```

#### **Format**

An object of class character of length 10.

## **Details**

Color names and referents in plots generated by plot\_crisk:

- 1. "cum": Cumulative risk curve
- 2. "rinc": Relative risk increments
- 3. "txt": Text labels
- 4. "aux": Auxiliary labels and lines
- 5. "high": Highlighting elements
- 6. "pas": Past/passed risk
- 7. "rem": Remaining risk
- 8. "delta": Delta-X- and -Y increments
- 9. "poly": Polygon of increments
- 10. "popu": Population partitions

## See Also

plot\_crisk plots cumulative risk curves; pal contains current color information; init\_pal initializes color information.

Other color palettes: pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_unikn, pal\_vir

```
pal_crisk # show color palette (and names)
```

pal\_kn 103

pal\_kn

Alternative color palette for kn.

## **Description**

pal\_kn is initialized to a vector of named elements (colors) to define an alternative (kn) scenario color scheme.

## Usage

pal\_kn

## **Format**

An object of class character of length 16.

#### **Details**

See pal for default color information.

Assign pal <- pal\_kn to use as default color scheme throughout the **riskyr** package.

## See Also

pal\_unikn contains more **unikn** colors; pal contains current color information; init\_pal initializes color information.

104 pal\_mbw

pal\_mbw

Modern and reduced color palette (in green/blue/bw).

## **Description**

pal\_mod is initialized to a vector of named colors to define a reduced modern scenario color scheme (in green/blue/bw).

## Usage

pal\_mbw

#### **Format**

An object of class character of length 16.

#### **Details**

See pal\_org for original color information; pal\_mod for a richer modern color palette; and pal\_bw for a more reduced black-and-white color palette.

Assign pal <- pal\_mbw to use as default color scheme throughout the **riskyr** package.

## See Also

```

pal\_mod 105

pal\_mod

Modern color palette (in green/blue/orange).

## **Description**

pal\_mod is initialized to a vector of named colors to define a modern scenario color scheme (in green/blue/orange).

## Usage

```
pal_mod
```

#### **Format**

An object of class character of length 16.

#### **Details**

See pal for default color information.

Assign pal <- pal\_mod to use as default color scheme throughout the **riskyr** package.

## See Also

```
pal contains current color information; init_pal initializes color information.

```

```
Other lists containing current scenario information: accu, freq, num, pal_bwp, pal_bw, pal_kn, pal_mbw, pal_org, pal_rgb, pal_unikn, pal_vir, pal, prob, txt_TF, txt_org, txt
```

```
pal_mod  # shows all color names and current values
pal_mod["hi"]  # shows the current color for hits (true positives, TP)
pal_mod["hi"] <- "gold"  # defines a new color for hits (true positives, TP)</pre>
```

106 pal\_rgb

pal\_org

Original color palette.

## **Description**

pal\_org is a copy of pal (to retrieve original set of colors in case pal is changed).

## Usage

```
pal_org
```

#### **Format**

An object of class character of length 16.

#### **Details**

See pal for default color information.

Assign pal <- pal\_org to re-set default color scheme throughout the **riskyr** package.

#### See Also

Other color palettes: pal_bwp, pal_bw, pal_crisk, pal_kn, pal_mbw, pal_mod, pal_rgb, pal_unikn, pal_vir
```

Other lists containing current scenario information: accu, freq, num, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_rgb, pal\_unikn, pal\_vir, pal, prob, txt\_TF, txt\_org, txt

## **Examples**

```
pal_org  # shows all color names and current values
pal_org["hi"]  # shows the current color for hits (true positives, TP)
pal_org["hi"] <- "gold"  # defines a new color for hits (true positives, TP)</pre>
```

pal\_rgb

Alternative color palette for graphs (with RGB colors).

### **Description**

pal\_rgb is initialized to a vector of named elements (colors) to define an alternative (reduced) scenario color scheme (using red, green, and blue colors).

## Usage

```
pal_rgb
```

pal\_unikn 107

## **Format**

An object of class character of length 16.

#### **Details**

See pal for default color information.

Assign pal <- pal\_rgb to use as default color scheme throughout the **riskyr** package.

#### See Also

```
pal contains current color information; init_pal initializes color information.

Other color palettes: pal_bwp, pal_bw, pal_crisk, pal_kn, pal_mbw, pal_mod, pal_org, pal_unikn, pal_vir

Other lists containing current scenario information: accu, freq, num, pal_bwp, pal_bw, pal_kn, pal_mbw, pal_mod, pal_org, pal_unikn, pal_vir, pal, prob, txt_TF, txt_org, txt
```

## **Examples**

```
pal_rgb  # shows all color names and current values
pal_rgb["hi"]  # shows the current color for hits (true positives, TP)
pal_rgb["hi"] <- "gold"  # defines a new color for hits (true positives, TP)</pre>
```

pal\_unikn

Alternative color palette for unikn.

# Description

pal\_unikn is initialized to a vector of named elements (colors) to define an alternative (unikn) scenario color scheme.

#### **Usage**

```
pal_unikn
```

### **Format**

An object of class character of length 16.

## **Details**

See pal for default color information.

Assign pal <- pal\_unikn to use as default color scheme throughout the **riskyr** package.

108 pal\_vir

#### See Also

pal\_kn contains fewer **unikn** colors; pal contains current color information; init\_pal initializes color information.

```
Other color palettes: pal_bwp, pal_bw, pal_crisk, pal_kn, pal_mbw, pal_mod, pal_org, pal_rgb, pal_vir
```

Other lists containing current scenario information: accu, freq, num, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_vir, pal, prob, txt\_TF, txt\_org, txt

## **Examples**

```
pal_unikn  # shows all color names and current values
pal_unikn["hi"]  # shows the current color for hits (true positives, TP)
pal_unikn["hi"] <- "grey"  # defines a new color for hits (true positives, TP)</pre>
```

pal\_vir

Alternative color palette using viridis colors.

## Description

pal\_vir is initialized to a vector of named elements (colors) to define a scenario color scheme modeled on the viridis color scale.

## Usage

pal\_vir

#### **Format**

An object of class character of length 16.

#### **Details**

These colors are select by the Matplotlib viridis color map created by Stéfan van der Walt and Nathaniel Smith. See the viridisLite package (maintained by Simon Garnier) for further information.

Assign pal <- pal\_vir to use as default color scheme throughout the **riskyr** package.

plot.box 109

# **Examples**

```
pal_vir  # shows all color names and current values
pal_vir["hi"]  # shows the current color for hits (true positives, TP)
pal_vir["hi"] <- "green3"  # defines a new color for hits (true positives, TP)</pre>
```

plot.box

Plot a frequency box object.

# Description

plot. box is a utility method that allows to plot low level boxes for riskyr plots.

# Usage

```
## S3 method for class 'box'
plot(x, cur_freq = freq, lbl_txt = txt, col_pal = pal, ...)
```

# **Arguments**

x	The box (i.e., an object of class box) to be plotted.
cur_freq	Current frequency information (see freq for details).
lbl_txt	Current text information (see txt for details).
col_pal	Current color palette (see pal for details).
•••	Additional (graphical) parameters to be passed to the underlying plotting functions.

# **Details**

plot.riskyr also uses the text settings specified in the "riskyr" object.

### See Also

```
Other utility functions: as_pb(), as_pc()
```

110 plot.riskyr

plot.riskyr

Plot a riskyr scenario.

### **Description**

plot.riskyr is a method that allows to generate different plot types from a "riskyr" object.

#### Usage

```
## S3 method for class 'riskyr'
plot(x = NULL, type = "prism", main = NULL, sub = NULL, ...)
```

## **Arguments**

Х

An object of class "riskyr", usually a result of a call to riskyr. Pre-defined scenarios are also of type "riskyr".

type

The type of plot to be generated.

main

Text label for main plot title. Default: main = NULL (using x\$scen\_lbl per default).

sub

Text label for plot subtitle (on 2nd line). Default: sub = NULL (using sub = "type" shows plot type).

The following plot types are currently available:

- 1. type = "prism" or type = "net" or type = "tree": Risk information is plotted in a network diagram of frequencies and probabilities (default). See plot\_prism for further options.
- 2. type = "tab" or type = "ftab": Risk information is plotted as a 2-by-2 frequency or contingency table. See plot\_tab for further options.
- 3. type = "area" or type = "mosaic": Risk information is plotted as a mosaic plot (scaled area). See plot\_area for further options.
- 4. type = "bar" or type = "fbar": Risk information is plotted as a bar chart. See plot\_bar for further options.
- 5. type = "icons" or type = "iconarray": The underlying population is plotted as an array of icons. See plot\_icons for further options.
- 6. type = "curve" or type = "curves": Draws curves of selected values (including PPV, NPV) See plot\_curve for further options.
- 7. type = "plane" or type = "planes": Draws a 3D-plane of selected values (e.g., predictive values PPV or NPV) See plot\_plane for further options.

Additional parameters to be passed to the underlying plotting functions.

#### **Details**

plot.riskyr also uses the text settings specified in the "riskyr" object.

### See Also

```
riskyr initializes a riskyr scenario.

Other visualization functions: plot_area(), plot_bar(), plot_crisk(), plot_curve(), plot_fnet(), plot_icons(), plot_mosaic(), plot_plane(), plot_prism(), plot_tab(), plot_tree()

Other riskyr scenario functions: riskyr(), summary.riskyr()
```

#### **Examples**

```
# Select a scenario (from list of scenarios):
s1 <- scenarios$n1 # select scenario 1 from scenarios</pre>
plot(s1) # default plot (type = "prism")
# Plot types currently available:
plot(s1, type = "prism")
                                       # prism/network diagram (default)
plot(s1, type = "tree", by = "cd")
                                   # tree diagram (only 1 perspective)
plot(s1, type = "area")
                                       # area/mosaic plot
plot(s1, type = "tab")
                                       # 2x2 frequency/contingency table
                                  # bar plot
plot(s1, type = "bar", dir = 2)
plot(s1, type = "icons")
                                       # icon array
plot(s1, type = "curve", what = "all") # curves as fn. of prev
plot(s1, type = "plane", what = "NPV") # plane as function of sens & spec
plot(s1, type = "default")
                                      # unknown type: use default plot
```

plot\_area

Plot an area diagram of probabilities or frequencies.

# **Description**

plot\_area assigns the total probability or population frequency to an area (square or rectangle) and shows the probability or frequency of 4 classification cases (hi, mi, fa, cr) as relative proportions of this area.

### Usage

```
plot_area(
   prev = num$prev,
   sens = num$sens,
   mirt = NA,
   spec = num$spec,
   fart = NA,
   N = num$N,
   by = "cddc",
   p_split = "v",
   area = "sq",
   scale = "p",
   round = TRUE,
```

```
sample = FALSE,
  sum_w = 0.1,
  gaps = c(NA, NA),
  f_1b1 = "num",
  f_{lbl_sep} = NA,
  f_1bl_sum = "num",
  f_{lbl_hd} = "nam",
  f_1wd = 0,
  p_1b1 = NA
  arr_c = -3,
  col_p = c(grey(0.15, 0.99), "yellow", "yellow"),
  brd_dis = 0.06,
  lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_lbl = 0.9,
  cex_p_lbl = NA,
  col_pal = pal,
 mar_notes = FALSE,
)
```

# **Arguments**

The condition's prevalence prev (i.e., the probability of condition being TRUE). prev

sens The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its comple-

ment mirt is provided.

The decision's miss rate mirt (i.e., the conditional probability of a negative decimirt sion provided that the condition is TRUE). mirt is optional when its complement

sens is provided.

The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its

complement fart is provided.

The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its

complement spec is provided.

The number of individuals in the population. A suitable value of N is computed, if not provided. Note: N is not represented in the plot, but used for computing

frequency information freq from current probabilities prob.

A character code specifying 2 perspectives that split the population into subsets, with 6 options:

1. "cddc": by condition (cd) and by decision (dc) (default);

2. "cdac": by condition (cd) and by accuracy (ac);

3. "dccd": by decision (dc) and by condition (cd);

spec

fart

Ν

by

- 4. "dcac": by decision (dc) and by accuracy (ac);
- 5. "accd": by accuracy (ac) and by condition (cd);
- 6. "acdc": by accuracy (ac) and by decision (dc).

Primary perspective for population split, with 2 options: p\_split

- 1. "v": vertical (default);
- 2. "h": horizontal.

A character code specifying the shape of the main area, with 2 options:

- 1. "sq": main area is scaled to a square (default);
- 2. "no": no scaling (rectangular area fills plot size).

scale Scale probabilities and corresponding area dimensions either by exact probability or by (rounded or non-rounded) frequency, with 2 options:

- 1. "p": scale main area dimensions by exact probability (default);
- 2. "f": re-compute probabilities from (rounded or non-rounded) frequencies and scale main area dimensions by their frequency.

Note: scale setting matters for the display of probability values and for area plots with small population sizes N when round = TRUE.

A Boolean option specifying whether computed frequencies are rounded to integers. Default: round = TRUE.

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

Border width of 2 perspective summaries (on top and left borders) of main area as a proportion of area size (i.e., in range 0 <= sum\_w <= 1). Default: sum\_w = .10. Setting sum\_w = 0, NA, or NULL removes summaries; setting sum\_w = 1 scales summaries to same size as main areas.

Size of gaps (as binary numeric vector) specifying the width of vertical and horizontal gaps as proportions of area size. Defaults: gaps = c(.02, .00) for  $p_{split} = v''$  and gaps = c(.00, .02) for  $p_{split} = h''$ .

Type of label for showing frequency values in 4 main areas, with 6 options:

- 1. "def": abbreviated names and frequency values;
- 2. "abb": abbreviated frequency names only (as specified in code);
- 3. "nam": names only (as specified in lbl\_txt = txt);
- 4. "num": numeric frequency values only (default);
- 5. "namnum": names (as specified in lbl\_txt = txt) and numeric values;
- 6. "no": no frequency labels (same for f\_lbl = NA or NULL).

Label separator for main frequencies (used for f\_lbl = "def" OR "namnum"). f\_lbl\_sep Use f\_lbl\_sep = ":\n" to add a line break between name and numeric value. Default:  $f_{bl} = NA$  (set to " = " or ":\n" based on  $f_{bl}$ .

f\_lbl\_sum Type of label for showing frequency values in summary cells, with same 6 options as f\_lbl (above). Default: f\_lbl\_sum = "num": numeric values only.

> Type of label for showing frequency values in header, with same 6 options as f\_lbl (above). Default: f\_lbl\_hd = "nam": names only (as specified in  $lbl_txt = txt$ ).

area

round

sample

sum\_w

gaps

f\_1b1

f\_lbl\_hd

f_lwd	Line width of areas. Default: f_lwd = 0.
p_lbl	Type of label for showing 3 key probability links and values, with 7 options:
	1. "def": show links and abbreviated names and probability values;
	2. "abb": show links and abbreviated probability names;
	3. "nam": show links and probability names (as specified in code);
	4. "num": show links and numeric probability values;
	5. "namnum": show links with names and numeric probability values;
	6. "no": show links with no labels;
	7. NA: show no labels or links (same for p_1b1 = NULL, default).
arr_c	Arrow code for symbols at ends of probability links (as a numeric value -3 <= arr_c <= +6), with the following options:
	• -1 to -3: points at one/other/both end/s;
	• 0: no symbols;
	• +1 to +3: V-arrow at one/other/both end/s;
	• +4 to +6: T-arrow at one/other/both end/s.
	Default: $arr_c = -3$ (points at both ends).
col_p	Colors of probability links (as vector of 3 colors). Default: col_p = c(grey(.15, .99), "yellow", "yellow"). (Also consider: "black", "cornsilk", "whitesmoke").
brd_dis	Distance of probability links from area border (as proportion of area width). Default: brd_dis = .06. Note: Adjust to avoid overlapping labels. Negative values show links outside of main area.
lbl_txt	Default label set for text elements. Default: lbl_txt = txt.
main	Text label for main plot title. Default: main = txt\$scen_lbl.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for text labels (frequencies and headers). Default: cex_lbl = .90.
cex_p_lbl	Scaling factor for text labels (probabilities). Default: cex_p_lbl = cex_lbl05.
col_pal	Color palette. Default: col_pal = pal.
mar_notes	Boolean option for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters.

# **Details**

plot\_area computes probabilities prob and frequencies freq from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) or existing frequency information freq and a population size of N individuals.

plot\_area generalizes and replaces plot\_mosaic. by removing the dependency on the R packages vcd and grid and providing many additional options.

#### Value

Nothing (NULL).

```

plot\_bar 117

```
plot_area(f_lbl = "num", p_lbl = NA, col_pal = pal_rgb) # no borders around boxes
```

plot\_bar

Plot bar charts of population frequencies.

# Description

plot\_bar draws bar charts that represent the proportions of frequencies in the current population popu as relatives sizes of rectangular areas.

# Usage

```
plot_bar(
 prev = num$prev,
  sens = num$sens,
 mirt = NA,
  spec = num$spec,
  fart = NA,
 N = num$N,
 by = "all",
  dir = 1,
  scale = "f",
  round = TRUE,
  sample = FALSE,
  f_1b1 = "num",
  f_lwd = 1,
  lty = 0,
  lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  col_pal = pal,
 mar_notes = FALSE,
)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.

plot\_bar

spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
N	The number of individuals in the population. (This value is not represented in the plot, but used when new frequency information freq and a new population table popu are computed from scratch from current probabilities.)
by	A character code specifying the perspective (or the dimension by which the population is split into 2 subsets) with the following options:  1. by = "cd": by condition;
	2. by = "dc": by decision;
	3. by = "ac": by accuracy;
	4. by = "all" combines perspectives (5 bars, default).
dir	Number of directions in which bars are plotted. Options:
	1. dir = 1: uni-directional bars (all up, default);
	2. dir = 2: bi-directional bars (up vs. down).
scale	Scale the heights of bars either by current frequencies (scale = "f") or by exact probabilities (scale = "p"). Default: scale = "f". For large population sizes N and when round = FALSE, both settings yield the same bar heights.
round	Boolean option specifying whether computed frequencies are to be rounded to integers. Default: round = TRUE.
sample	Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.
f_lbl	Type of frequency labels, as character code with the following options:
	1. f_lbl = "nam": names;
	2. f_lbl = "num": numeric values (default);
	<ul><li>3. f_lbl = "abb": abbreviated names;</li><li>4. f_lbl = NA/NULL/"no": no labels;</li></ul>
	5. f_lbl = "any": abbreviated names and numeric values (abb = num).
f_lwd	Line width of frequency box (border). Values of NA/NULL/0 set 1wd to invisible tiny_lwd <001 and 1ty <- 0 ("blank"). Default: f_lwd = 1.
lty	Line type of frequency box (border). Values of NA/NULL/0 set lty to lty $<$ 0. Default: lty = 0 (i.e., no line).
lbl_txt	Current text information (for labels, titles, etc.). Default: lbl_txt = txt (see init_txt).
main	Text label for main plot title. Default: main = txt\$scen_lbl.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	<b>Deprecated</b> text label for current plot title. Replaced by main.
col_pal	Current color palette. Default: col_pal = pal (see init_pal).
mar_notes	Boolean option for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters (e.g., cex, font, lty, etc.).

plot\_bar 119

#### **Details**

If a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) is provided, new frequency information freq and a new population table popu are computed from scratch. Otherwise, the existing population popu is shown.

By default, plot\_bar uses current frequencies (i.e., rounded or not rounded, depending on the value of round) as bar heights, rather than using exact probabilities to scale bar heights (i.e., default scaling is scale = "f"). Using the option scale = "p" scales bar heights by probabilities (e.g., showing bars for non-natural frequencies even when frequencies are rounded). When round = FALSE, bar heights for scale = "f" and for scale = "p" are identical.

The distinction between scale = "f" and scale = "p" matters mostly for small populations sizes N (e.g., when N < 100). For rounded and small frequency values (e.g., freq < 10) switching from scale = "f" to scale = "p" yields different plots.

plot\_bar contrasts compound frequencies along 1 dimension (height). See plot\_mosaic for 2-dimensional visualizations (as areas) and various box) options in plot\_tree and plot\_fnet for related functions.

```

plot\_crisk

Plot a cumulative risk curve.

## Description

plot\_crisk creates visualizations of cumulative risks.

## Usage

```
plot_crisk(
    x,
    y = NULL,
    x_from = NA,
    x_to = NA,
    fit_curve = FALSE,
    show_pas = FALSE,
    show_rem = FALSE,
    show_pop = FALSE,
```

plot\_crisk 121

```
show_aux = FALSE,
show_num = FALSE,
show_inc = FALSE,
show_grid = FALSE,
col_pal = pal_crisk,
arr_c = -3,
main = txt$scen_lbl,
sub = "type",
title_lbl = NULL,
x_lbl = "Age (in years)",
y_lbl = "Population risk",
y2_lbl = "",
mar_notes = FALSE,
...
)
```

# Arguments

Х	Data or values of an x-dimension on which risk is expressed (required). If x but not y is provided, xy.coords from <b>grDevices</b> is used to determine x- and y-values.
у	Values of cumulative risks on a y-dimension (optional, if x is an appropriate structure), as monotonically increasing percentage values (ranging from 0 to 100). Default: y = NULL.
x_from	Start value of risk increment. Default: $x_from = NA$ .
x_to	End value of risk increment. Default: $x_to = NA$ .
fit_curve	Boolean: Fit a curve to x-y-data? Default: fit_curve = FALSE.
show_pas	Boolean: Show past/passed risk? Default: show_pas = FALSE.
show_rem	Boolean: Show remaining risk? Default: show_rem = FALSE.
show_pop	Boolean: Show population partitions? Default: show_pop = FALSE.
show_aux	Boolean: Show auxiliary elements (i.e., explanatory lines, points, and labels)? Default: show_aux = FALSE.
show_num	Boolean: Show numeric values, provided that show_aux = TRUE. Default: show_num = FALSE.
show_inc	Boolean: Show risk increments? Default: show_inc = FALSE.
show_grid	Boolean: Show grid lines? Default: show_grid = FALSE.
col_pal	Color palette (as a named vector). Default: col_pal = pal_crisk.
arr_c	Arrow code for symbols at ends of population links (as a numeric value $-3 \le arr_c \le +6$ ), with the following options:
	• -1 to -3: points at one/other/both end/s;

- 0: no symbols;
- +1 to +3: V-arrow at one/other/both end/s;
- +4 to +6: T-arrow at one/other/both end/s.

Default:  $arr_c = -3$  (points at both ends).

plot\_crisk

main	Text label for main plot title. Default: main = txt\$scen_lbl.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
x_lbl	Text label of x-axis (at bottom). Default: x_1b1 = "Age (in years)".
y_lbl	Text label of y-axis (on left). Default: y_lbl = "Population risk".
y2_1b1	Text label of 2nd y-axis (on right). Default: y2_1b1 = "" (formerly "Remaining risk").
mar_notes	Boolean option for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters.

#### **Details**

plot\_crisk assumes data inputs x and y that correspond to each other so that y is a (monotonically increasing) probability density function (over cumulative risk amounts represented by y as a function of x).

Inputs to x and y must typically be of the same length. If x but not y is provided, xy.coords from **grDevices** is used to determine x- and y-values.

The risk events quantified by the cumulative risk values in y are assumed to be uni-directional, non-reversible, and expressed as percentages (ranging from 0 to 100). Thus, an element in the population can only switch its status once (from 'unaffected' to 'affected' by the risk factor).

A cumulative risk increment is computed for an interval ranging from  $x_{from}$  to  $x_{to}$ . If risk values for  $x_{from}$  or  $x_{to}$  are not provided (i.e., in x and y), a curve is fitted to predict y by x (by fit\_curve = TRUE).

Note that naive interpretations allow for both overestimation (e.g., reading off population values) and underestimation (e.g., reading off future risk increases without re-scaling to remaining population).

For instructional purposes, plot\_crisk provides options for showing/hiding various elements required for computing or comprehending cumulative risk increments.

Color information is based on a vector with named colors col\_pal = pal\_crisk.

### Value

Nothing (NULL).

#### See Also

```
pal_crisk corresponding color palette.

plot_crisk(x, y, fit_curve = TRUE) # fitting curve to provided data
# Training versions:
plot_crisk(x, y, 44, 64, show_pas = TRUE) # past/passed risk only
plot_crisk(x, y, 44, 64, show_rem = TRUE) # remaining risk only
plot_crisk(x, y, 44, 64, show_pas = TRUE, show_rem = TRUE) # both risks
plot_crisk(x, y, 44, 64, show_aux = TRUE) # auxiliary lines + axis
plot_crisk(x, y, 44, 64, show_aux = TRUE, show_pop = TRUE) # + population parts
plot_crisk(x, y, 44, 64, show_aux = TRUE, show_num = TRUE) # + numeric values
plot_crisk(x, y, 44, 85, show_aux = TRUE, show_pop = TRUE, show_num = TRUE) # + aux/pop/num
# Note: Showing ALL is likely to overplot/overwhelm:
plot_crisk(x, y, x_from = 47, x_to = 67, fit_curve = TRUE,
           main = "The main title", sub = "Some subtitle",
           show_pas = TRUE, show_rem = TRUE, show_aux = TRUE, show_pop = TRUE,
           show_num = TRUE, show_inc = TRUE, show_grid = TRUE, mar_notes = TRUE)
# Small x- and y-values and linear increases:
plot_crisk(x = 2:10, y = seq(12, 28, by = 2), x_from = 4.5, x_to = 8.5,
           show_pas = TRUE, show_rem = TRUE, show_aux = TRUE, show_pop = TRUE,
           show_num = TRUE, show_inc = TRUE)
```

plot\_curve

Plot curves of selected values (e.g., PPV or NPV) as a function of prevalence.

## Description

plot\_curve draws curves of selected values (including PPV, NPV) as a function of the prevalence (prev) for given values of sensitivity sens (or miss rate mirt) and specificity spec (or false alarm rate fart).

### **Usage**

```
plot_curve(
  prev = num$prev,
  sens = num$sens,
```

```
mirt = NA,
  spec = num spec,
  fart = NA,
 what = c("prev", "PPV", "NPV"),
 p_{lbl} = "def",
 p_lwd = 2,
 what_col = pal,
 uc = 0,
  show_points = TRUE,
 log_scale = FALSE,
 prev_range = c(0, 1),
 lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_{1b1} = 0.85,
 col_pal = pal,
 mar_notes = FALSE,
)
```

#### **Arguments**

prev The condition's prevalence prev (i.e., the probability of condition being TRUE). If prev = NA, the curves in what are plotted without points (i.e., show\_points =

FALSE).

The decision's sensitivity sens (i.e., the conditional probability of a positive sens

decision provided that the condition is TRUE), sens is optional when its comple-

ment mirt is provided.

The decision's miss rate mirt (i.e., the conditional probability of a negative decimirt sion provided that the condition is TRUE). mirt is optional when its complement

sens is provided.

spec The decision's specificity spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its com-

plement fart is provided.

fart The decision's false alarm rate fart (i.e., the conditional probability of a pos-

itive decision provided that the condition is FALSE). fart is optional when its

complement spec is provided.

what Vector of character codes that specify the selection of curves to be plotted. Currently available options are c("prev", "PPV", "NPV", "ppod", "acc") (short-

cut: what = "all"). Default: what = c("prev", "PPV", "NPV").

p\_lbl Type of label for shown probability values, with the following options:

1. "abb": show abbreviated probability names;

2. "def": show abbreviated probability names and values (default);

3. "nam": show only probability names (as specified in code);

4. "num": show only numeric probability values;

	5. "namnum": show names and numeric probability values;
	6. "no": hide labels (same for p_lbl = NA or NULL).
p_lwd	Line widths of probability curves plotted. Default: p_lwd = 2.
what_col	Vector of colors corresponding to the elements specified in what. Default: what_col = pal.
uc	Uncertainty range, given as a percentage of the current prev, sens, and spec values (added in both directions). Default: $uc = .00$ (i.e., no uncertainty). Plausible ranges are $0 < uc < .25$ .
show_points	Boolean value for showing the point of intersection with the current prevalence prev in all selected curves. Default: show_points = TRUE.
log_scale	Boolean value for switching from a linear to a logarithmic x-axis. Default: log_scale = FALSE.
prev_range	Range (minimum and maximum) of prev values on x-axis (i.e., values in $c(0, 1)$ range). Default: prev_range = $c(0, 1)$ .
lbl_txt	Labels and text elements. Default: lbl_txt = txt.
main	Text label for main plot title. Default: main = txt\$scen_lbl.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for the size of text labels (e.g., on axes, legend, margin text). Default: cex_lbl = .85.
col_pal	Color palette (if what_col is unspecified). Default: col_pal = pal.
mar_notes	Boolean value for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters.

### **Details**

If no prevalence value is provided (i.e., prev = NA), the desired probability curves are plotted without showing specific points (i.e., show\_points = FALSE).

Note that a population size N is not needed for computing probability information prob. (An arbitrary value can be used when computing frequency information freq from current probabilities prob.)

plot\_curve is a generalization of plot\_PV (see legacy code) that allows plotting additional dependent values.

#### See Also

comp\_prob computes current probability information; prob contains current probability information; comp\_freq computes current frequency information; freq contains current frequency information; num for basic numeric parameters; txt for current text settings; pal for current color settings.

plot_curve(main = "Black-and-white print version",
           what = "all", col_pal = pal_bwp)
```

plot\_fnet

Plot frequency net diagram of frequencies and probabilities.

# **Description**

plot\_fnet plots a frequency net of from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) or existing frequency information freq and a population size of N individuals.

# Usage

```
plot_fnet(
  prev = num$prev,
  sens = num$sens,
 mirt = NA,
  spec = num spec,
  fart = NA,
 N = num N,
  by = "cddc"
  area = "no"
  scale = "p",
  round = TRUE,
  sample = FALSE,
  f_{lbl} = "num",
  f_{loc} = NA
  f_lwd = 0,
  p_lwd = 1,
  p_scale = FALSE,
  p_1b1 = mix,
  arr_c = NA,
  joint_p = TRUE,
  lbl_txt = txt,
  main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_lbl = 0.9,
  cex_p_lbl = NA,
  col_pal = pal,
 mar_notes = FALSE,
)
```

### **Arguments**

prev

The condition's prevalence prev (i.e., the probability of condition being TRUE).

sens

The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.

mirt

The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE), mirt is optional when its complement sens is provided.

spec

The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.

fart

The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

Ν

The number of individuals in the population. A suitable value of N is computed, if not provided. Note that a population size N is not needed for computing current probability information prob, but is needed for computing frequency information freq from current probabilities prob.

A character code specifying 1 or 2 perspective(s) that split(s) the population into 2 subsets. Specifying 1 perspective plots a frequency tree (single tree) with 3 options:

- 1. "cd": by condition only;
- 2. "dc": by decision only;
- 3. "ac": by accuracy only.

Specifying 2 perspectives plots a frequency prism (double tree) with 6 options:

- 1. "cddc": by condition (cd) and by decision (dc) (default);
- 2. "cdac": by condition (cd) and by accuracy (ac);
- 3. "dccd": by decision (dc) and by condition (cd);
- 4. "dcac": by decision (dc) and by accuracy (ac);
- 5. "accd": by accuracy (ac) and by condition (cd);
- 6. "acdc": by accuracy (ac) and by decision (dc).

area

A character code specifying the shapes of the frequency boxes, with 2 options:

- 1. "no": rectangular frequency boxes, not scaled (default);
- 2. "sq": frequency boxes are squares (scaled relative to N).

scale

Scale probabilities and corresponding area dimensions either by exact probability or by (rounded or non-rounded) frequency, with 2 options:

- 1. "p": scale main area dimensions by exact probability (default);
- 2. "f": re-compute probabilities from (rounded or non-rounded) frequencies and scale main area dimensions by their frequency.

Note: scale setting matters for the display of probability values and for area plots with small population sizes N when round = TRUE.

round

Boolean option specifying whether computed frequencies are rounded to integers. Default: round = TRUE.

sample

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

by

 $f_{lbl}$ Type of label for showing frequency values in 4 main areas, with 6 options: 1. "def": abbreviated names and frequency values; 2. "abb": abbreviated frequency names only (as specified in code); 3. "nam": names only (as specified in lbl\_txt = txt); 4. "num": numeric frequency values only (default); 5. "namnum": names (as specified in lbl\_txt = txt) and numeric values; 6. "no": no frequency labels (same for f\_lb1 = NA or NULL). Label separator for main frequencies (used for f\_lbl = "def" OR "namnum"). f\_lbl\_sep Use f\_lbl\_sep = ":\n" to add a line break between name and numeric value. Default:  $f_{bl} = NA$  (set to " = " or ":\n" based on  $f_{bl}$ . f\_lwd Line width of areas. Default:  $f_lwd = 0$ . Line width of probability links. Default: p\_lwd = 1, but consider increasing p\_lwd when setting  $p_scale = TRUE$ . Boolean option for scaling current widths of probability links (as set by p\_lwd) p\_scale by the current probability values. Default: p\_scale = FALSE. Type of label for showing probability links and values, with many options: p\_lbl 1. "abb": show links and abbreviated probability names; 2. "def": show links and abbreviated probability names and values; 3. "min": show links and minimum (prominent) probability names; 4. "mix": show links and prominent probability names and all values (default): 5. "nam": show links and probability names (as specified in code); 6. "num": show links and numeric probability values; 7. "namnum": show links with names and numeric probability values; 8. "no": show links with no labels (same for p\_lb1 = NA or NULL). arr\_c Arrow code for symbols at ends of probability links (as a numeric value -3 <= arr\_c <= +6), with the following options: • -1 to -3: points at one/other/both end/s; • 0: no symbols; • +1 to +3: V-arrow at one/other/both end/s; • +4 to +6: T-arrow at one/other/both end/s. Default: arr\_c = NA, but adjusted by area. joint\_p Boolean options for showing links to joint probabilities (i.e., diagonals from N in center to joint frequencies in 4 corners). Default: joint\_p = TRUE. lbl\_txt Default label set for text elements. Default: lbl\_txt = txt. Text label for main plot title. Default: main = txt\$scen\_lbl. main sub Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type. title\_lbl **Deprecated** text label for current plot title. Replaced by main. cex\_lbl Scaling factor for text labels (frequencies and headers). Default: cex\_lbl = .90.

```
cex_p_lbl Scaling factor for text labels (probabilities). Default: cex_p_lbl = cex_lbl - .05.

col_pal Color palette. Default: col_pal = pal.

mar_notes Boolean option for showing margin notes. Default: mar_notes = FALSE.

... Other (graphical) parameters.
```

#### **Details**

plot\_fnet shows frequencies as nodes and probabilities as links (like trees and double trees generated by plot\_prism), but combines elements from 2x2 tables (see plot\_tab) and tree diagrams.

Similar to other 2D-visualizations (e.g., , plot\_area, plot\_prism and plot\_tab), the frequency net selects and combines two perspectives (e.g., by = "cddc"). However, the frequency net is similar to a 2x2 table insofar as its perspectives (shown by arranging marginal frequencies in a vertical vs. horizontal fashion) do not suggest an order or dependency (in contrast to trees or mosaic plots). Additionally, the frequency net allows showing 3 kinds of (marginal, conditional, and joint) probabilities.

See the article by Binder K, Krauss S and Wiesner P (2020). A new visualization for probabilistic situations containing two binary events: The frequency net. Frontiers in Psychology, 11, 750. doi: 10.3389/fpsyg.2020.00750 for analysis and details.

#### Value

Nothing (NULL).

# Source

          main = "", mar_notes = FALSE) # remove titles and margin notes
plot_fnet(area = "no", f_lbl = "nam", p_lbl = "min", col_pal = pal_rgb)
plot_fnet(area = "sq", f_lbl = "nam", p_lbl = "num", col_pal = pal_rgb)
\# plot_fnet(area = "sq", f_lbl = "def", f_lbl_sep = ":\n", p_lbl = NA, f_lwd = 1, col_pal = pal_kn)
## Suggested combinations:
# plot_fnet(f_lbl = "nam", p_lbl = "mix") # basic plot
plot_fnet(f_lbl = "namnum", p_lbl = "num", cex_lbl = .80, cex_p_lbl = .75)
# plot_fnet(area = "no", f_lbl = "def", p_lbl = "abb", # def/abb labels
            f_lwd = .8, p_lwd = .8, lty = 2, col_pal = pal_bwp) # black-&-white
# plot_fnet(area = "sq", f_lbl = "nam", p_lbl = "abb", lbl_txt = txt_TF, col_pal = pal_bw)
plot_fnet(area = "sq", f_lbl = "num", p_lbl = "num", f_lwd = 1, col_pal = pal_rgb)
plot_fnet(area = "sq", f_lbl = "nam", p_lbl = "num", f_lwd = .5, col_pal = pal_rgb)
```

plot\_icons

Plot an icon array of a population.

# **Description**

plot\_icons plots a population of which individual's condition has been classified correctly or incorrectly as icons from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) or existing frequency information freq and a population size of N individuals.

### Usage

```
plot_icons(
   prev = num$prev,
   sens = num$sens,
   mirt = NA,
   spec = num$spec,
   fart = NA,
   N = freq$N,
   sample = FALSE,
   arr_type = "array",
   by = "all",
   ident_order = c("hi", "mi", "fa", "cr"),
   icon_types = 22,
   icon_size = NULL,
```

```
icon_brd_lwd = 1.5,
  block_d = NULL,
 border_d = 0.1,
  block_size_row = 10,
 block_size_col = 10,
  nblocks_row = NULL,
  nblocks_col = NULL,
  fill_array = "left",
  fill_blocks = "rowwise",
  lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_{lb1} = 0.9,
  col_pal = pal,
  transparency = 0.5,
 mar_notes = FALSE,
)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
N	The number of individuals in the population. A suitable value of N is computed, if not provided. If N is 100,000 or greater it is reduced to 10,000 for the array types if the frequencies allow it.
sample	Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.
arr_type	The icons can be arranged in different ways resulting in different types of displays:

1. arr\_type = "array": Icons are plotted in a classical icon array (default). Icons can be arranged in blocks using block\_d. The order of filling the array can be customized using fill\_array and fill\_blocks.

arr\_type = "shuffledarray": Icons are plotted in an icon array, but positions are shuffled (randomized). Icons can be arranged in blocks using block\_d. The order of filling the array can be customized using fill\_array and fill\_blocks.

- 3. arr\_type = "mosaic": Icons are ordered like in a mosaic plot. The area size displays the relative proportions of their frequencies.
- 4. arr\_type = "fillequal": Icons are positioned into equally sized blocks. Thus, their density reflects the relative proportions of their frequencies.
- 5. arr\_type = "fillleft": Icons are randomly filled from the left.
- 6. arr\_type = "filltop": Icons are randomly filled from the top.
- 7. arr\_type = "scatter": Icons are randomly scattered into the plot.

A character code specifying a perspective to split the population into subsets, with 4 options:

- "all": by condition (cd) and by decision (dc): hi, mi, fa, cr cases (default);
- "cd": by condition (cd) only: cond\_true vs. cond\_false cases;
- 3. "dc": by decision (dc) only: dec\_pos vs. dec\_neg cases;
- 4. "ac": by accuracy (ac) only: dec\_cor vs. dec\_err cases.

ident\_order The order in which icon identities (i.e., hi, mi, fa, and cr) are plotted. Default: ident\_order = c("hi", "mi", "fa", "cr")

icon\_types specifies the appearance of the icons as a vector. Default: icon\_types = 11 (i.e., squares with border). Accepts values from 1 to 25 (see ?points).

icon\_size specifies the size of the icons via cex Default: icon\_size = NULL for automatic calculation.

icon\_brd\_lwd specifies the border width of icons (if applicable). Default: icon\_brd\_lwd = 1.5. Set to NA for no border.

block\_d The distance between blocks. Default: block\_d = NULL for automatic calculation; (does not apply to "filleft", "filltop", and "scatter")

border\_d The distance of icons to the border. Default: border\_d = 0.1.

Additional options for controlling the arrangement of arrays (for arr\_type = "array" and "shuffledarray"):

block\_size\_row specifies how many icons should be in each block row. Default: block\_size\_row = 10.

block\_size\_col specifies how many icons should be in each block column. Default: block\_size\_col = 10.

nblocks\_row Number of blocks per row. Default: nblocks\_row = NULL for automatic calculation.

nblocks\_col Number of blocks per column. Default: nblocks\_col = NULL for automatic calculation.

fill\_array specifies how the blocks are filled into the array. Options: fill\_array = "left" (default) vs. "top".

by

fill_blocks	specifies how icons within blocks are filled. Options: fill_blocks = "rowwise" (default) and "colwise".  Generic text and color options:
lbl_txt	Default label set for text elements. Default: lbl_txt = txt.
main	Text label for main plot title. Default: main = txt\$scen_1b1.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
4:41- 161	Description of the state of the
title_lbl	<b>Deprecated</b> text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for text labels. Default: cex_lbl = .90.
_	
cex_lbl	Scaling factor for text labels. Default: cex_lb1 = .90.
cex_lbl col_pal	Scaling factor for text labels. Default: cex_lbl = .90.  Color palette. Default: col_pal = pal.  Specifies the transparency for overlapping icons (not for arr_type = "array"

#### **Details**

If probabilities are provided, a new list of natural frequencies freq is computed by comp\_freq. By contrast, if no probabilities are provided, the values currently contained in freq are used. By default, comp\_freq rounds frequencies to nearest integers to avoid decimal values in freq.

#### Value

Nothing (NULL).

```

### **Examples**

```
# Basics:
plot_icons(N = 1000)  # icon array with default settings (arr_type = "array")
plot_icons(arr_type = "shuffledarray", N = 1000)  # icon array with shuffled IDs

# Sampling:
plot_icons(N = 1000, prev = 1/2, sens = 2/3, spec = 6/7, sample = TRUE)

# array types:
plot_icons(arr_type = "mosaic", N = 1000)  # areas as in mosaic plot
plot_icons(arr_type = "fillequal", N = 1000)  # areas of equal size (probability as density)
plot_icons(arr_type = "filleft", N = 1000)  # icons filled from left to right (in columns)
plot_icons(arr_type = "filltop", N = 1000)  # icons filled from top to bottom (in rows)
plot_icons(arr_type = "scatter", N = 1000)  # icons randomly scattered

# by:
plot_icons(N = 1000, by = "all")  # hi, mi, fa, cr (TP, FN, FP, TN) cases
```

plot\_mosaic 137

plot\_mosaic

Plot a mosaic plot of population frequencies.

### **Description**

plot\_mosaic drew a mosaic plot that represents the proportions of frequencies in the current population as relatives sizes of rectangular areas.

# Usage

```
plot_mosaic(
   prev = num$prev,
   sens = num$sens,
   mirt = NA,
   spec = num$spec,
   fart = NA,
   N = num$N,
   by = "cddc",
   show_accu = TRUE,
   w_acc = 0.5,
   title_lbl = txt$scen_lbl,
   col_sdt = c(pal["hi"], pal["mi"], pal["fa"], pal["cr"])
)
```

plot\_plane

# **Arguments**

prev	The condition's prevalence prev.
sens	The decision's sensitivity sens.
mirt	The decision's miss rate mirt.
spec	The decision's specificity value spec.
fart	The decision's false alarm rate fart.
N	The number of individuals in the population.
by	A character code specifying the perspective (or categories by which the population is split into subsets) with 3 options:
	<ol> <li>"cddc" by condition x decision;</li> <li>"dccd" by decision x condition;</li> <li>"cdac" by condition x accuracy.</li> </ol>
show_accu	Option for showing current and exact accuracy metrics accu in the plot.
w_acc	Weighting parameter w used to compute weighted accuracy.
title_lbl	Text label for current plot title.
col_sdt	Colors for cases of 4 essential frequencies. Default: col_sdt = c(pal["hi"], pal["mi"], pal["fa"], pal["cr"]).

### **Details**

plot\_mosaic is deprecated - please use plot\_area instead.

#### See Also

```
plot_area is the new version of this function.
Other visualization functions: plot.riskyr(), plot_area(), plot_bar(), plot_crisk(), plot_curve(),
plot_fnet(), plot_icons(), plot_plane(), plot_prism(), plot_tab(), plot_tree()
```

# **Examples**

```
plot_mosaic() # plot with default options
```

# Description

plot\_plane draws a 3D-plane of selected values (e.g., predictive values PPV or NPV) as a function of a decision's sensitivity sens and specificity value spec for a given prevalence (prev).

plot\_plane 139

# Usage

```
plot_plane(
  prev = num$prev,
  sens = num$sens,
 mirt = NA,
  spec = num$spec,
  fart = NA,
 what = "PPV",
 what_col = pal,
 line_col = "grey85",
  sens_range = c(0, 1),
  spec_range = c(0, 1),
  step\_size = 0.05,
  show_points = TRUE,
  point_col = "yellow",
  theta = -45,
  phi = 0,
  p_1b1 = "def",
  lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_{1b1} = 0.85,
  col_pal = pal,
 mar_notes = FALSE,
)
```

# **Arguments**

prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided. If sens = NA, then show_points = FALSE.
mirt	The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided. If spec = NA, then show_points = FALSE.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.
what	A character code that specifies one metric to be plotted as a plane. Currently available options are c("PPV", "NPV", "ppod", "acc"). Default: what = "PPV".
what_col	Color for surface facets corresponding to the metric specified in what. Default: what_col uses color corresponding to what in current col_pal.

plot\_plane

line_col	Color for lines between surface facets. Default: line_col = "grey85".
sens_range	Range (minimum and maximum) of sens values on x-axis (i.e., values in $c(0, 1)$ range). Default: sens_range = $c(0, 1)$ .
spec_range	Range (minimum and maximum) of spec values on y-axis (i.e., values in $c(0, 1)$ range). Default: spec_range = $c(0, 1)$ .
step_size	Sets the granularity of the sens-by-spec grid. (in range .01 <= step_size <= 1). Default: step_size = .05.
show_points	Boolean option for showing the current value of the selected metric for the current conditions (prev, sens, spec) as a point on the plane. Default: show_points = TRUE.
point_col	Fill color for showing current value on plane. Default: point_col = "yellow".
theta	Horizontal rotation angle (used by persp). Default: theta = -45.
phi	Vertical rotation angle (used by persp). Default: phi = 0.
p_lbl	Type of label for shown probability values, with the following options:
	1. "abb": show abbreviated probability names;
	2. "def": show abbreviated probability names and values (default);
	3. "nam": show only probability names (as specified in code);
	4. "num": show only numeric probability values;
	5. "namnum": show names and numeric probability values;
71.7	6. "no": hide labels (same for p_lbl = NA or NULL).
lbl_txt	Labels and text elements. Default: lbl_txt = txt.
main	Text label for main plot title. Default: main = txt\$scen_1b1.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for the size of text labels (e.g., on axes, legend, margin text). Default: cex_lbl = .85.
col_pal	Color palette (if what_col is unspecified). Default: col_pal = pal.
mar_notes	Boolean value for showing margin notes. Default: mar_notes = FALSE.
•••	Other (graphical) parameters.

# **Details**

plot\_plane is a generalization of plot\_PV3d (see legacy code) that allows for additional dependent values.

plot_plane(prev = .02, sens = c(.8, .9), spec = c(.8, .8, .9, .9),
           sens_range = c(.7, 1), spec_range = c(.7, 1), step_size = .02) # zooming in
# Options:
# plot_plane(main = "No point and smaller labels", show_points = FALSE, cex_lbl = .60)
plot_plane(main = "Testing plot colors", what_col = "royalblue4", line_col = "sienna2")
plot_plane(main = "Testing b/w plot", what = "npv", what_col = "white", line_col = "black")
plot_plane(main = "Testing color pal_bwp", col_pal = pal_bwp)
plot_plane(step_size = .333, what_col = "firebrick") # => coarser granularity + color
plot_plane(step_size = .025, what_col = "chartreuse4") # => finer granularity + color
plot_plane(what_col = "steelblue4", theta = -90, phi = 50) # => rotated, from above
```

plot\_prism

Plot prism diagram of frequencies and probabilities.

### **Description**

plot\_prism plots a network diagram of from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) or existing frequency information freq and a population size of N individuals.

# Usage

```
plot_prism(
  prev = num$prev,
  sens = num$sens,
  mirt = NA,
  spec = num$spec,
  fart = NA,
  N = num$N,
```

```
by = "cddc",
  area = "no",
  scale = "p",
  round = TRUE,
  sample = FALSE,
  f_1b1 = "num",
  f_{lbl_sep} = NA,
  f_1wd = 0,
  p_lwd = 1,
  p_scale = FALSE,
 p_1bl = mix,
  arr_c = NA,
  lbl_txt = txt,
 main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_lbl = 0.9,
  cex_p_lbl = NA,
  col_pal = pal,
 mar_notes = FALSE,
)
```

#### **Arguments**

prev The condition's prevalence prev (i.e., the probability of condition being TRUE).

The decision's sensitivity sens (i.e., the conditional probability of a positive sens decision provided that the condition is TRUE). sens is optional when its comple-

ment mirt is provided.

The decision's miss rate mirt (i.e., the conditional probability of a negative decimirt

sion provided that the condition is TRUE). mirt is optional when its complement

sens is provided.

The decision's specificity value spec (i.e., the conditional probability of a negspec

ative decision provided that the condition is FALSE). spec is optional when its

complement fart is provided.

The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its

complement spec is provided.

The number of individuals in the population. A suitable value of N is computed, if not provided. Note that a population size N is not needed for computing current probability information prob, but is needed for computing frequency informa-

tion freq from current probabilities prob.

A character code specifying 1 or 2 perspective(s) that split(s) the population into 2 subsets. Specifying 1 perspective plots a frequency tree (single tree) with 3 options:

1. "cd": by condition only;

2. "dc": by decision only;

fart

Ν

by

3. "ac": by accuracy only.

Specifying 2 perspectives plots a frequency prism (double tree) with 6 options:

- 1. "cddc": by condition (cd) and by decision (dc) (default);
- 2. "cdac": by condition (cd) and by accuracy (ac);
- 3. "dccd": by decision (dc) and by condition (cd);
- 4. "dcac": by decision (dc) and by accuracy (ac);
- 5. "accd": by accuracy (ac) and by condition (cd);
- 6. "acdc": by accuracy (ac) and by decision (dc).

A character code specifying the shapes of the frequency boxes, with 3 options:

- 1. "no": rectangular frequency boxes, not scaled (default);
- 2. "hr": frequency boxes are horizontal rectangles (scaled relative to N).
- 3. "sq": frequency boxes are squares (scaled relative to N).

Scale probabilities and corresponding node dimensions either by exact probability or by (rounded or non-rounded) frequency, with 2 options:

- 1. "p": scale node dimensions by exact probability (default);
- 2. "f": re-compute probabilities from (rounded or non-rounded) frequencies and scale node dimensions by their frequency.

Note: scale setting matters for the display of probability values and for area plots with small population sizes N when round = TRUE.

Boolean option specifying whether computed frequencies are rounded to integers. Default: round = TRUE.

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

Type of label for showing frequency values in nodes, with 6 options:

- 1. "def": abbreviated names and frequency values;
- 2. "abb": abbreviated frequency names only (as specified in code);
- 3. "nam": names only (as specified in lbl\_txt = txt);
- 4. "num": numeric frequency values only (default);
- 5. "namnum": names (as specified in lbl\_txt = txt) and numeric values;
- 6. "no": no frequency labels (same for f\_lbl = NA or NULL).

f\_lbl\_sep Separator for frequency labels (used for f\_lbl = "def" OR "namnum"). Use f\_lbl\_sep = ":\n" to add a line break between name and numeric value. Default:  $f_{bl} = NA$  (set to " = " or ":\n" based on  $f_{bl}$ .

f\_lwd Line width of areas. Default:  $f_lwd = 0$ .

p\_lwd Line width of probability links. Default: p\_lwd = 1, but consider increasing when setting  $p_scale = TRUE$ .

p\_scale Boolean option for scaling current widths of probability links (as set by p\_lwd) by the current probability values. Default: p\_scale = FALSE.

Type of label for showing 3 key probability links and values, with many options:

- 1. "abb": show links and abbreviated probability names;
- 2. "def": show links and abbreviated probability names and values;

area

scale

round

sample

f\_1b1

p\_lbl

- 3. "min": show links and minimum (prominent) probability names;
- 4. "mix": show links and prominent probability names and all values (default);
- 5. "nam": show links and probability names (as specified in code);
- 6. "num": show links and numeric probability values;
- 7. "namnum": show links with names and numeric probability values;
- 8. "no": show links with no labels (same for p\_lb1 = NA or NULL).

arr\_c Arrow code for symbols at ends of probability links (as a numeric value -3 <= arr\_c <= +6), with the following options:

- -1 to -3: points at one/other/both end/s;
- 0: no symbols;
- +1 to +3: V-arrow at one/other/both end/s;
- +4 to +6: T-arrow at one/other/both end/s.

Default: arr\_c = NA, but adjusted by area.

lbl_txt	Default label set for text elements. Default: lbl_txt = txt.
main	Text label for main plot title. Default: main = txt\$scen_lbl.
sub	Text label for plot subtitle (on 2nd line). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for text labels (frequencies and headers). Default: $cex_lbl = .90$ .
cex_p_lbl	Scaling factor for text labels (probabilities). Default: $cex_p_lbl = cex_lbl05$ .
col_pal	Color palette. Default: col_pal = pal.
mar_notes	Boolean option for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters.

# Details

plot\_prism generalizes and replaces plot\_fnet by removing the dependency on the R package diagram and providing many additional options.

# Value

Nothing (NULL).

# See Also

plot\_fnet for older (obsolete) version; plot\_area for plotting mosaic plot (scaling area dimensions); plot\_bar for plotting frequencies as vertical bars; plot\_tab for plotting table (without scaling area dimensions); pal contains current color settings; txt contains current text settings.

Other visualization functions: plot.riskyr(), plot\_area(), plot\_bar(), plot\_crisk(), plot\_curve(), plot\_fnet(), plot\_icons(), plot\_mosaic(), plot\_plane(), plot\_tab(), plot\_tree()

plot\_prism 145

# **Examples**

```
## Basics:
# (1) Using global prob and freq values:
plot_prism() # default prism plot,
# same as:
# plot_prism(by = "cddc", area = "no", scale = "p",
             f_{lbl} = "num", f_{lwd} = 0, cex_{lbl} = .90,
#
             p_{lbl} = mix, arr_c = -2, cex_p_{lbl} = NA
# (2) Providing values:
plot_prism(N = 10, prev = 1/3, sens = 3/5, spec = 4/5, area = "hr")
plot_prism(N = 10, prev = 1/4, sens = 3/5, spec = 2/5, area = "sq", mar_notes = TRUE)
# (3) Rounding and sampling:
plot_prism(N = 100, prev = 1/3, sens = 2/3, spec = 6/7, area = "hr", round = FALSE)
plot_prism(N = 100, prev = 1/3, sens = 2/3, spec = 6/7, area = "hr", sample = TRUE, scale = "freq")
# (4) Custom colors and text:
plot_prism(col_pal = pal_bw, f_lwd = .5, p_lwd = .5, lty = 2, # custom fbox color, prob links,
           font = 3, cex_p_1b1 = .75)
                                                                # and text labels
my_txt <- init_txt(cond_lbl = "The Truth", cond_true_lbl = "so true", cond_false_lbl = "so false",</pre>
                   hi_lbl = "TP", mi_lbl = "FN", fa_lbl = "FP", cr_lbl = "TN")
my\_col \leftarrow init\_pal(N\_col = rgb(0, 169, 224, max = 255), # seeblau
            hi_col = "gold", mi_col = "firebrick1", fa_col = "firebrick2", cr_col = "orange")
plot_prism(f_lbl = "nam", lbl_txt = my_txt,
           col_pal = my_col, f_lwd = .5)
## Local values and custom color/txt settings:
plot_prism(N = 7, prev = 1/2, sens = 3/5, spec = 4/5, round = FALSE,
           by = "cdac", lbl_txt = txt_org, f_lbl = "namnum", f_lbl_sep = ":\n",
           f_lwd = 1, col_pal = pal_rgb) # custom colors
plot_prism(N = 5, prev = 1/2, sens = .8, spec = .5, scale = "p", # note scale!
           by = "cddc", area = "hr", col_pal = pal_bw, f_lwd = 1) # custom colors
plot_prism(N = 3, prev = .50, sens = .50, spec = .50, scale = "p",
                                                                             # note scale!
         area = "sq", lbl_txt = txt_org, f_lbl = "namnum", f_lbl_sep = ":\n", # custom text
         col_pal = pal_kn, f_lwd = .5)
                                                                           # custom colors
## Plot versions:
# (A) tree/single tree (nchar(by) == 2):
      3 versions:
plot_prism(by = "cd", f_lbl = "def", col_pal = pal_mod) # by condition (freq boxes: hi mi fa cr)
plot_prism(by = "dc", f_lbl = "def", col_pal = pal_mod) # by decision (freq boxes: hi fa mi cr)
plot_prism(by = "ac", f_lbl = "def", col_pal = pal_mod) # by accuracy (freq boxes: hi cr mi fa)
# (B) prism/double tree (nchar(by) == 4):
      6 (3 x 2) versions (+ 3 redundant ones):
plot_prism(by = "cddc") # v01 (default)
plot_prism(by = "cdac")
                           # v02
# plot_prism(by = "cdcd") # (+) Message
```

plot\_prism

```
plot_prism(by = "dccd") # v03
plot_prism(by = "dcac")
                          # v04
# plot_prism(by = "dcdc") # (+) Message
plot_prism(by = "accd")
                          # v05
plot_prism(by = "acdc")
                          # v06
# plot_prism(by = "acac") # (+) Message
## Other options:
# area:
# plot_prism(area = "no") # rectangular boxes (default): (same if area = NA/NULL)
plot_prism(area = "hr")  # horizontal rectangles (widths on each level sum to N)
plot_prism(area = "sq") # squares (areas on each level sum to N)
# scale (matters for scaled areas and small N):
plot_prism(N = 5, prev = .3, sens = .8, spec = .6,
          area = "hr", scale = "p") # widths scaled by prob
plot_prism(N = 5, prev = .3, sens = .8, spec = .6,
           area = "hr", scale = "f") # widths scaled by (rounded or non-rounded) freq
plot_prism(N = 4, prev = .2, sens = .7, spec = .8,
          area = "sq", scale = "p") # areas scaled by prob
plot_prism(N = 4, prev = .2, sens = .7, spec = .8,
           area = "sq", scale = "f") # areas scaled by (rounded or non-rounded) freq
## Frequency boxes:
# f_lbl:
plot_prism(f_lbl = "abb")
                              # abbreviated freq names (variable names)
plot\_prism(f\_lbl = "nam") # only freq names
plot_prism(f_lbl = "num")
                             # only numeric freq values (default)
plot_prism(f_lbl = "namnum") # names and numeric freq values
# plot_prism(f_lbl = "namnum", cex_lbl = .75) # smaller freq labels
# plot_prism(f_lbl = NA)  # no freq labels
# plot_prism(f_lbl = "def") # informative default: short name and numeric value (abb = num)
# plot_prism(f_lwd = 0) # no lines (default), set to tiny_lwd = .001, lty = 0 (same if NA/NULL)
plot_prism(f_lwd = 1) # basic lines
plot_prism(f_lwd = 3) # thicker lines
# plot_prism(f_lwd = .5) # thinner lines
## Probability links:
# Scale link widths (p_lwd & p_scale):
plot_prism(p_lwd = 6, p_scale = TRUE)
plot_prism(area = "sq", f_lbl = "num", p_lbl = NA, col_pal = pal_bw, p_lwd = 6, p_scale = TRUE)
# p_lbl:
plot_prism(p_lbl = "mix")
                              # abbreviated names with numeric values (abb = num)
plot_prism(p_lbl = "min")
                              # minimal names (of key probabilities)
# plot_prism(p_lbl = NA)
                             # no prob labels (NA/NULL/"none")
plot_prism(p_lbl = "nam")
                             # only prob names
plot_prism(p_lbl = "num")
                            # only numeric prob values
```

```
plot_prism(p_lbl = "namnum") # names and numeric prob values
# plot_prism(p_lbl = "namnum", cex_p_lbl = .70) # smaller prob labels
# plot_prism(by = "cddc", p_lbl = "min") # minimal labels
# plot_prism(by = "cdac", p_lbl = "min")
# plot_prism(by = "cddc", p_lbl = "mix") # mix abbreviated names and numeric values
# plot_prism(by = "cdac", p_lbl = "mix")
# plot_prism(by = "cddc", p_lbl = "abb") # abbreviated names
# plot_prism(by = "cdac", p_lbl = "abb")
# plot_prism(p_lbl = "any") # short name and value (abb = num)
# arr_c:
plot_prism(arr_c = 0) # acc_c = 0: no arrows
plot_prism(arr_c = -3) # arr_c = -1 to -3: points at both ends
plot_prism(arr_c = -2) # point at far end
plot_prism(arr_c = +2) # crr_c = 1-3: V-shape arrows at far end
# plot_prism(arr_c = +3) # V-shape arrows at both ends
# plot_prism(arr_c = +6) # arr_c = 4-6: T-shape arrows
## Plain plot versions:
plot_prism(area = "no", f_lbl = "def", p_lbl = "num", col_pal = pal_mod, f_lwd = 1,
          main = NA, sub = NA, mar_notes = FALSE) # remove titles and margin notes
plot_prism(area = "no", f_lbl = "nam", p_lbl = "min",
          main = NA, sub = "My subtitle", col_pal = pal_rgb) # only subtitle
plot_prism(area = "no", f_lbl = "num", p_lbl = "num", col_pal = pal_kn) # default title & subtitle
plot_prism(area = "hr", f_lbl = "nam", f_lwd = .5, p_lwd = .5, col_pal = pal_bwp)
plot_prism(area = "hr", f_lbl = "nam", f_lwd = .5, p_lbl = "num", main = NA, sub = NA)
# plot_prism(area = "sq", f_lbl = "nam", p_lbl = NA, col_pal = pal_rgb)
plot_prism(area = "sq", f_lbl = "def", f_lbl_sep = ":\n", p_lbl = NA, f_lwd = 1, col_pal = pal_kn)
## Suggested combinations:
plot_prism(f_lbl = "nam", p_lbl = "mix", col_pal = pal_mod) # basic plot
plot_prism(f_lbl = "namnum", p_lbl = "num", cex_lbl = .80, cex_p_lbl = .75)
# plot_prism(area = "no", f_lbl = "def", p_lbl = "abb",
                                                         # def/abb labels
            f_lwd = .8, p_lwd = .8, lty = 3, col_pal = pal_bwp) # black-\&-white
plot_prism(area = "hr", f_lbl = "num", p_lbl = "mix", f_lwd = 1, cex_p_lbl = .75)
plot_prism(area = "hr", f_lbl = "nam", p_lbl = "num", p_lwd = 6, p_scale = TRUE)
plot_prism(area = "hr", f_lbl = "abb", p_lbl = "abb", f_lwd = 1, col_pal = pal_kn)
# plot_prism(area = "sq", f_lbl = "nam", p_lbl = "abb", lbl_txt = txt_TF)
plot_prism(area = "sq", f_lbl = "num", p_lbl = "num", f_lwd = 1, col_pal = pal_rgb)
plot_prism(area = "sq", f_lbl = "namnum", p_lbl = "mix", f_lwd = .5, col_pal = pal_kn)
```

# **Description**

plot\_tab plots a 2 x 2 contingency table (aka. confusion table) of 4 classification cases (hi, mi, fa, cr) and corresponding row and column sums.

# Usage

```
plot_tab(
  prev = num$prev,
  sens = num$sens,
 mirt = NA,
  spec = num spec,
  fart = NA,
 N = num N,
  by = "cddc"
  p_split = "v",
  area = "no",
  scale = "p",
  round = TRUE,
  sample = FALSE,
  f_1b1 = "num",
  f_{loc} = NA
  f_{lbl_sum} = f_{lbl_sum}
  f_{bl} = "nam",
  f_1wd = 0,
  gaps = c(NA, NA),
  brd_w = 0.1,
  p_1b1 = NA,
  arr_c = -3,
  col_p = c(grey(0.15, 0.99), "yellow", "yellow"),
  brd_dis = 0.3,
  lbl_txt = txt,
  main = txt$scen_lbl,
  sub = "type",
  title_lbl = NULL,
  cex_1bl = 0.9,
  cex_p_lbl = NA,
  col_pal = pal,
 mar_notes = FALSE,
)
```

# **Arguments**

sens

prev The condition's prevalence prev (i.e., the probability of condition being TRUE).

The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.

mirt

The decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE). mirt is optional when its complement sens is provided.

spec

The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.

fart

The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.

Ν

The number of individuals in the population. A suitable value of N is computed, if not provided. Note: N is not represented in the plot, but used for computing frequency information freq from current probabilities prob.

by

A character code specifying 2 perspectives that split the population into subsets, with 6 options:

- 1. "cddc": by condition (cd) and by decision (dc) (default);
- 2. "cdac": by condition (cd) and by accuracy (ac);
- 3. "dccd": by decision (dc) and by condition (cd);
- 4. "dcac": by decision (dc) and by accuracy (ac);
- 5. "accd": by accuracy (ac) and by condition (cd);
- 6. "acdc": by accuracy (ac) and by decision (dc).

p\_split

Primary perspective for population split, with 2 options:

- 1. "v": vertical (default);
- 2. "h": horizontal.

Note: In contrast to plot\_area, this setting only determines which 3 probability links are shown (e.g., when p\_link = "def").

area

A character code specifying the shape of the main area, with 4 options:

- 1. "sq": main area is scaled to square;
- 2. "no": no scaling (rectangular area fills plot size; default).

scale

Scale probabilities (but not table cell dimensions) either by exact probability or by (rounded or non-rounded) frequency, with 2 options:

- 1. "p": scale main area dimensions by exact probability (default);
- 2. "f": re-compute probabilities from (rounded or non-rounded) frequencies and scale main area dimensions by their frequency.

Note: scale setting matters for the display of probability values and for area plots with small population sizes N when round = TRUE.

round

A Boolean option specifying whether computed frequencies are rounded to integers. Default: round = TRUE.

sample

Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.

f\_lbl

Type of label for showing frequency values in 4 main areas, with 6 options:

- 1. "def": abbreviated names and frequency values (default);
- 2. "abb": abbreviated frequency names only (as specified in code);

- 3. "nam": names only (as specified in lbl\_txt = txt);
- 4. "num": numeric frequency values only;
- 5. "namnum": names (as specified in lbl\_txt = txt) and numeric values;
- 6. "no": no frequency labels (same for f\_lb1 = NA or NULL).

f\_lbl\_sep

Label separator for main frequencies (used for f\_lbl = "def" OR "namnum").

Use f\_lbl\_sep = ":\n" to add a line break between name and numeric value.

Default: f\_lbl\_sep = NA (set to " = " or ":\n" based on f\_lbl).

f\_lbl\_sum Type of label for showing frequency values in summary cells, with same 6 options as f\_lbl (above). Default: f\_lbl\_sum = "def": abbreviated names and numeric values.

f\_lbl\_hd Type of label for showing frequency values in header, with same 6 options
as f\_lbl (above). Default: f\_lbl\_hd = "nam": names only (as specified in
lbl\_txt = txt).

f\_lwd Line width of areas. Default: f\_lwd = 1.

Size of gaps (as binary numeric vector) specifying the widths of vertical and horizontal gaps between  $2 \times 2$  table and sums (in bottom row and right column). Default: gaps = c(.05, .06).

Border width for showing 2 perspective summaries on top and left borders of main area (as a proportion of area size) in a range  $\emptyset \le brd_w \le 1$ . Default:  $brd_w = .10$ .

p\_lbl Type of label for showing 3 key probability links and values, with 7 options:

- 1. "def": show links and abbreviated names and probability values;
- 2. "abb": show links and abbreviated probability names;
- 3. "nam": show links and probability names (as specified in code);
- 4. "num": show links and numeric probability values;
- 5. "namnum": show links with names and numeric probability values;
- 6. "no": show links with no labels;
- 7. NA: no link (same for p\_lbl = NULL, default).

arr\_c Arrow code for symbols at ends of probability links (as a numeric value -3 <= arr\_c <= +6), with the following options:

- -1 to -3: points at one/other/both end/s;
- 0: no symbols;
- +1 to +3: V-arrow at one/other/both end/s;
- +4 to +6: T-arrow at one/other/both end/s.

Default:  $arr_c = -3$  (points at both ends).

col\_p Colors of probability links (as vector of 3 colors). Default: col\_p = c(grey(.15, .99), "yellow", "yellow").

brd\_dis Distance of probability links from cell center (as a constant). Default: brd\_dis = .30. Note: Adjust to avoid overlapping labels.

lbl\_txt Default label set for text elements. Default: lbl\_txt = txt.

main Text label for main plot title. Default: main = txt\$scen\_lbl.

sub	Text label for the subtitle of the plot (shown below the main title). Default: sub = "type" shows information on current plot type.
title_lbl	Deprecated text label for current plot title. Replaced by main.
cex_lbl	Scaling factor for text labels (frequencies and headers). Default: cex_lbl = .90.
cex_p_lbl	Scaling factor for text labels (probabilities). Default: $cex_p_1b1 = cex_1b105$ .
col_pal	Color palette. Default: col_pal = pal.
mar_notes	Boolean option for showing margin notes. Default: mar_notes = FALSE.
	Other (graphical) parameters.

# **Details**

plot\_tab computes its frequencies freq from a sufficient and valid set of 3 essential probabilities (prev, and sens or its complement mirt, and spec or its complement fart) or existing frequency information freq and a population size of N individuals.

plot\_tab is derived from plot\_area, but does not scale the dimensions of table cells.

#### Value

Nothing (NULL).

### See Also

plot\_area for plotting mosaic plot (scaling area dimensions); pal contains current color settings; txt contains current text settings.

```
Other visualization functions: plot.riskyr(), plot_area(), plot_bar(), plot_crisk(), plot_curve(), plot_fnet(), plot_icons(), plot_mosaic(), plot_plane(), plot_prism(), plot_tree()
```

# **Examples**

```
## Basics:
# (1) Plotting global freq and prob values:
plot_tab()
plot_tab(area = "sq", f_lwd = 3, col_pal = pal_rgb)
plot_tab(f_lbl = "namnum", f_lbl_sep = " = ", brd_w = .10, f_lwd = .5)
# (2) Computing local freq and prob values:
plot_tab(prev = .5, sens = 4/5, spec = 3/5, N = 10, f_lwd = 1)
# (3) Rounding and sampling:
plot_tab(N = 100, prev = 1/3, sens = 2/3, spec = 6/7, round = FALSE)
plot_tab(N = 100, prev = 1/3, sens = 2/3, spec = 6/7, sample = TRUE)
## Plot versions:
# by x p_split [yields (3 x 2) x 2] = 12 versions]:
plot_tab(by = "cddc", p_split = "v", p_lbl = "def") # v01 (see v07)
plot_tab(by = "cdac", p_split = "v", p_lbl = "def") # v02 (see v11)
```

```
plot_tab(by = "cddc", p_split = "h", p_lbl = "def") # v03 (see v05)
plot_tab(by = "cdac", p_split = "h", p_lbl = "def")  # v04 (see v09)
# plot_tab(by = "dccd", p_split = "h", p_lbl = "def") # v07 (v01 rotated)
# plot_tab(by = "dccd", p_split = "v", p_lbl = "def") # v05 (v03 rotated)
plot_tab(by = "dcac", p_split = "v", p_lbl = "def") # v06 (see v12)
plot_tab(by = "dcac", p_split = "h", p_lbl = "def") # v08 (see v10)
# plot_tab(by = "accd", p_split = "v", p_lbl = "def") # v09 (v04 rotated)
# plot_tab(by = "acdc", p_split = "v", p_lbl = "def") # v10 (v08 rotated)
# plot_tab(by = "accd", p_split = "h", p_lbl = "def") # v11 (v02 rotated)
# plot_tab(by = "acdc", p_split = "h", p_lbl = "def") # v12 (v06 rotated)
## Explore labels and links:
# plot_tab(f_lbl = "abb", p_lbl = NA) # abbr. labels, no probability links
# plot_tab(f_lbl = "num", f_lbl_sum = "abb", p_lbl = "num", f_lbl_hd = "abb")
plot_tab(f_lbl = "def", f_lbl_sum = "def", p_lbl = "def", f_lbl_hd = "nam")
plot_tab(f_lbl = "namnum", f_lbl_sep = " = ",
         f_lbl_sum = "namnum", f_lbl_hd = "num", p_lbl = "namnum")
## Misc. options:
                           # area: square
plot_tab(area = "sq")
# plot_tab(main = "")
                       # no titles
# plot_tab(mar_notes = TRUE) # show margin notes
plot_tab(by = "cddc", gaps = c(.08, .00), area = "sq")
# plot_tab(by = "cddc", gaps = c(.02, .08), p_split = "h") # gaps
# Showing prob as lines:
plot_tab(prev = 1/4, sens = 6/7, spec = 3/5, N = 100,
        by = "cddc", p_split = "v", col_pal = pal_rgb,
        p_{bl} = "def", brd_{dis} = .25, arr_{c} = +3, lwd = 2
# Custom text labels and colors:
plot_tab(prev = .5, sens = 4/5, spec = 3/5, N = 10,
        by = "cddc", p_split = "v", area = "no",
        main = "Main title", sub = "The subtitle", lbl_txt = txt_TF, # custom text
         f_lbl = "namnum", f_lbl_sep = ":\n", f_lbl_sum = "num", f_lbl_hd = "nam",
        col_pal = pal_vir, f_lwd = 3) # custom colors
plot_tab(prev = .5, sens = 3/5, spec = 4/5, N = 10,
        by = "cddc", p_split = "h", area = "sq",
        main = NA, sub = NA, lbl_txt = txt_org, # custom text
         f_{bl} = "namnum", f_{bl} = ":\n", f_{bl} = "num", f_{bl} = "nam",
        col_pal = pal_kn, f_lwd = 1) # custom colors
## Note some differences to plot_area (i.e., area/mosaic plot):
# In plot_tab:
# (1) p_split does not matter (except for selecting different prob links):
plot_tab(by = "cddc", p_split = "v") # v01 (see v07)
plot_tab(by = "cddc", p_split = "h") # v03 (see v05)
# (2) scale does not matter for dimensions (which are constant),
     BUT matters for values shown in prob links and on margins:
plot_tab(N = 5, prev = .3, sens = .9, spec = .5,
```

plot\_tree 153

```
by = "cddc", scale = "p", p_lbl = "def", round = TRUE) # (a) exact prob values
plot_tab(N = 5, prev = .3, sens = .9, spec = .5,
    by = "cddc", scale = "f", p_lbl = "def", round = TRUE) # (b) prob from rounded freq!
plot_tab(N = 5, prev = .3, sens = .9, spec = .5,
    by = "cddc", scale = "f", p_lbl = "def", round = FALSE) # (c) same values as (a)
```

plot\_tree

Plot a tree diagram of frequencies and probabilities.

# **Description**

plot\_tree drew a tree diagram of frequencies (as nodes) and probabilities (as edges).

## Usage

```
plot_tree(
  prev = num$prev,
  sens = num$sens,
  mirt = NA,
  spec = num$spec,
  fart = NA,
  N = freq$N,
  round = TRUE,
  by = "cd",
  area = "no",
  p_1b1 = "num",
  show_accu = TRUE,
  w_{acc} = 0.5,
  title_lbl = txt$scen_lbl,
  popu_lbl = txt$popu_lbl,
  cond_true_lbl = txt$cond_true_lbl,
  cond_false_lbl = txt$cond_false_lbl,
  dec_pos_lbl = txt$dec_pos_lbl,
  dec_neg_lbl = txt$dec_neg_lbl,
  hi_lbl = txt$hi_lbl,
  mi_lbl = txt$mi_lbl,
  fa_lbl = txt$fa_lbl,
  cr_lbl = txt$cr_lbl,
  col_{txt} = grey(0.01, alpha = 0.99),
  cex_{1b1} = 0.85,
  col_boxes = pal,
  col\_border = grey(0.33, alpha = 0.99),
  1wd = 1.5,
  box_lwd = 1.5,
  col\_shadow = grey(0.11, alpha = 0.99),
  cex_shadow = 0
)
```

plot\_tree

# Arguments

The condition's prevalence prev. prev The decision's sensitivity sens. sens The decision's miss rate mirt. mirt spec The decision's specificity value spec. The decision's false alarm rate fart. fart The number of individuals in the population. A Boolean option specifying whether computed frequencies are rounded to inround tegers. Default: round = TRUE. A character code specifying the perspective (or category by which the populaby tion is split into subsets) with 3 options: 1. "cd" ... by condition; 2. "dc" ... by decision; 3. "ac" ... by accuracy. A character code specifying the area of the boxes (or their relative sizes) with 3 area options: 1. "no" ... all boxes are shown with the same size; 2. "sq" ... boxes are squares with area sizes scaled proportional to frequencies (default); 3. "hr" ... boxes are horizontal rectangles with area sizes scaled proportional to frequencies. A character code specifying the type of probability information (on edges) with p\_lbl 4 options: 1. "nam" ... names of probabilities; 2. "num" ... numeric values of probabilities (rounded to 3 decimals, default); 3. "mix" ... names of essential probabilities, values of complements; 4. "min" ... minimal labels: names of essential probabilities. Option for showing current accuracy metrics accu on the margin of the plot. show\_accu Weighting parameter w used to compute weighted accuracy w\_acc in comp\_accu\_freq. w\_acc Various other options allow the customization of text labels and colors: title\_lbl Text label for current plot title. popu\_lbl Text label for current population popu. cond\_true\_lbl Text label for current cases of cond\_true. cond\_false\_lbl Text label for current cases of cond\_false. Text label for current cases of dec\_pos. dec\_pos\_lbl dec\_neg\_lbl Text label for current cases of dec\_neg. Text label for hits hi. hi\_lbl mi\_lbl Text label for misses mi. fa\_lbl Text label for false alarms fa.

рори 155

cr_lbl	Text label for correct rejections cr.
col_txt	Color for text labels (in boxes).
cex_lbl	Scaling factor for text labels (in boxes and on arrows).
col_boxes	Colors of boxes (a single color or a vector with named colors matching the number of current boxes). Default: Current color information contained in pal.
col_border	Color of borders. Default: col_border = grey(.33, alpha = .99).
lwd	Width of arrows.
box_lwd	Width of boxes.
col_shadow	Color of box shadows. Default: col_shadow = grey(.11, alpha = .99).
cex_shadow	Scaling factor of shadows (values $> 0$ showing shadows). Default: cex_shadow = $0$ .

#### **Details**

plot\_tree is deprecated - please use plot\_prism instead.

#### Value

Nothing (NULL).

#### See Also

```
plot_prism is the new version of this function.
Other visualization functions: plot.riskyr(), plot_area(), plot_bar(), plot_crisk(), plot_curve(),
plot_fnet(), plot_icons(), plot_mosaic(), plot_plane(), plot_prism(), plot_tab()
```

#### **Examples**

```
plot_tree() # frequency tree with current default options (by = "cd")
# alternative perspectives:
plot_tree(by = "dc") # tree by decision
plot_tree(by = "ac") # tree by accuracy
# See plot_prism for details and additional options.
```

popu

A table of cases (in the current population).

# Description

popu is an R data frame that is computed by comp\_popu from the current frequency information (contained in freq). Each individual is represented as a row; columns represent the individual's condition (TRUE or FALSE), a corresponding decision (also encoded as TRUE = positive or FALSE = negative), and its classification (i.e., its case or cell combination, in SDT terms), as true positive (hit hi), false negative (miss mi), false positive (false alarm fa), or true negative (correct rejection cr).

156 ppod

# Usage

popu

#### **Format**

An object of class NULL of length 0.

#### **Details**

#' popu is initialized to NULL and needs to be computed by calling comp\_popu with current parameter settings.

By default, comp\_popu uses the current information contained in txt to define text labels.

A visualization of the current population popu is provided by plot\_icons.

# Value

A data frame popu containing N rows (individual cases) and 3 columns ("Truth", "Decision", "SDT") encoded as ordered factors (with 2, 2, and 4 levels, respectively).

#### See Also

the corresponding generating function comp\_popu; read\_popu interprets a data frame as a riskyr scenario; num for basic numeric parameters; freq for current frequency information; txt for current text settings.

# **Examples**

```
popu <- comp_popu()  # => initializes popu with current values of freq and txt dim(popu)  # => N x 3 head(popu)  # => shows head of data frame
```

ppod

The proportion (or baseline) of a positive decision (aka. bias).

# **Description**

ppod defines the proportion (baseline probability or rate) of a decision being positive (but not necessarily accurate/correct).

# Usage

ppod

# **Format**

An object of class numeric of length 1.

ppod 157

#### **Details**

ppod is also known as bias, though the latter term is also used to describe a systematic tendency to deviate in any — rather than just positive — direction.

Understanding or obtaining the proportion of positive decisions ppod:

- Definition: ppod is the (non-conditional) probability:
   ppod = p(decision = positive)
   or the base rate (or baseline probability) of a decision being positive (but not necessarily accurate/correct).
- Perspective: ppod classifies a population of N individuals by decision (ppod = dec\_pos/N). ppod is the "by decision" counterpart to prev (which adopts a "by condition" perspective).
- Alternative names: base rate of positive decisions (PR), proportion predicted or diagnosed, rate of decision = positive cases
- In terms of frequencies, ppod is the ratio of dec\_pos (i.e., hi + fa) divided by N (i.e., hi + mi + fa + cr):
   ppod = dec\_pos/N = (hi + fa)/(hi + mi + fa + cr)
- Dependencies: ppod is a feature of the decision process or diagnostic procedure.

  However, the conditional probabilities sens, mirt, spec, fart, PPV, and NPV also depend on the condition's prevalence prev.

### References

# See Also

prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; freq contains current frequency information; comp\_freq computes current frequency information; is\_prob verifies probabilities.

Other probabilities: FDR, FOR, NPV, PPV, acc, err, fart, mirt, prev, sens, spec

# **Examples**

```
ppod <- .50  # sets a rate of positive decisions of 50% ppod <- 50/100  # (decision = TRUE) for 50 out of 100 individuals is_prob(ppod)  # TRUE
```

158 PPV

PPV The positive predictive value of a decision process or diagnostic procedure.

# **Description**

PPV defines some decision's positive predictive value (PPV): The conditional probability of the condition being TRUE provided that the decision is positive.

# Usage

PPV

#### **Format**

An object of class numeric of length 1.

# **Details**

Understanding or obtaining the positive predictive value PPV:

 Definition: PPV is the conditional probability for the condition being TRUE given a positive decision:

```
PPV = p(condition = TRUE | decision = positive) or the probability of a positive decision being correct.
```

- Perspective: PPV further classifies the subset of dec\_pos individuals by condition (PPV = hi/dec\_pos = hi/(hi + fa)).
- Alternative names: precision
- Relationships:

a. PPV is the complement of the false discovery or false detection rate FDR:

```
PPV = 1 - FDR
```

b. PPV is the opposite conditional probability – but not the complement – of the sensitivity sens:

```
sens = p(decision = positive | condition = TRUE)
```

- In terms of frequencies, PPV is the ratio of hi divided by dec\_pos (i.e., hi + fa): PPV = hi/dec\_pos = hi/(hi + fa)
- Dependencies: PPV is a feature of a decision process or diagnostic procedure and similar to the sensitivity sens a measure of correct decisions (positive decisions that are actually TRUE).

However, due to being a conditional probability, the value of PPV is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

# References

Consult Wikipedia for additional information.

prev 159

#### See Also

comp\_PPV computes PPV; prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

Other probabilities: FDR, FOR, NPV, acc, err, fart, mirt, ppod, prev, sens, spec

# **Examples**

```
PPV <- .55  # sets a positive predictive value of 55%   
PPV <- 55/100  # (condition = TRUE) for 55 out of 100 people with (decision = positive) is_prob(PPV)  # TRUE
```

prev

The prevalence (baseline probability) of a condition.

# **Description**

prev defines a condition's prevalence value (or baseline probability): The probability of the condition being TRUE.

## Usage

prev

#### **Format**

An object of class numeric of length 1.

# **Details**

Understanding or obtaining the prevalence value prev:

- Definition: prev is the (non-conditional) probability: prev = p(condition = TRUE) or the base rate (or baseline probability) of the condition's occurrence or truth.
- In terms of frequencies, prev is the ratio of cond\_true (i.e., hi + mi) divided by N (i.e., hi + mi + fa + cr):

```
prev = cond_true/N = (hi + mi)/(hi + mi + fa + cr)
```

- Perspective: prev classifies a population of N individuals by condition (prev = cond\_true/N). prev is the "by condition" counterpart to ppod (when adopting a "by decision" perspective) and to acc (when adopting a "by accuracy" perspective).
- Alternative names: base rate of condition, proportion affected, rate of condition = TRUE cases. prev is often distinguished from the *incidence rate* (i.e., the rate of new cases within a certain time period).

160 print.summary.riskyr

• Dependencies: prev is a feature of the population and of the condition, but independent of the decision process or diagnostic procedure.

While the value of prev does *not* depend on features of the decision process or diagnostic procedure, prev must be taken into account when computing the conditional probabilities sens, mirt, spec, fart, PPV, and NPV (as they depend on prev).

#### References

prev <- 10/100  # (condition = TRUE) for 10 out of 100 individuals
is_prob(prev)  # TRUE</pre>
```

```
print.summary.riskyr Print summary information of a riskyr scenario.
```

#### **Description**

print.summary.riskyr provides a print method for objects of class "summary.riskyr".

# Usage

```
## S3 method for class 'summary.riskyr'
print(x = NULL, ...)
```

### Arguments

- x An object of class "summary.riskyr", usually a result of a call to summary.riskyr.
- ... Additional parameters (to be passed to generic print function).

#### Format

Printed output of a "summary.riskyr" object.

prob 161

#### See Also

riskyr initializes a riskyr scenario.

# **Examples**

summary(scenarios\$n4)

prob

List current probability information.

# **Description**

prob is a list of named numeric variables containing 3 essential (1 non-conditional prev and 2 conditional sens and spec) probabilities and 8 derived (ppod and acc, as well as 6 conditional) probabilities:

# Usage

prob

#### **Format**

An object of class list of length 13.

# **Details**

prob currently contains the following probabilities:

- 1. the condition's prevalence prev (i.e., the probability of the condition being TRUE): prev = cond\_true/N.
- 2. the decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE).
- 3. the decision's miss rate mirt (i.e., the conditional probability of a negative decision provided that the condition is TRUE).
- 4. the decision's specificity spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE).
- 5. the decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE).
- 6. the proportion (baseline probability or rate) of the decision being positive ppod (but not necessarily true): ppod = dec\_pos/N.
- 7. the decision's positive predictive value PPV (i.e., the conditional probability of the condition being TRUE provided that the decision is positive).
- 8. the decision's false detection (or false discovery) rate FDR (i.e., the conditional probability of the condition being FALSE provided that the decision is positive).

162 prob

9. the decision's negative predictive value NPV (i.e., the conditional probability of the condition being FALSE provided that the decision is negative).

- 10. the decision's false omission rate FOR (i.e., the conditional probability of the condition being TRUE provided that the decision is negative).
- 11. the accuracy acc (i.e., probability of correct decisions dec\_cor or correspondence of decisions to conditions).
- 12. the conditional probability p\_acc\_hi (i.e., the probability of hi given that the decision is correct dec\_cor).
- 13. the conditional probability p\_err\_fa (i.e., the probability of fa given that the decision is erroneous dec\_err).

These probabilities are computed from basic probabilities (contained in num) and computed by using comp\_prob.

The list prob is the probability counterpart to the list containing frequency information freq.

Note that inputs of extreme probabilities (of 0 or 1) may yield unexpected values (e.g., an NPV value of NaN when is\_extreme\_prob\_set evaluates to TRUE).

Key relationships between frequencies and probabilities (see documentation of comp\_freq or comp\_prob for details):

- Three perspectives on a population: by condition / by decision / by accuracy.
- Defining probabilities in terms of frequencies:
   Probabilities can be computed as ratios between frequencies, but beware of rounding issues.

Functions translating between representational formats: comp\_prob\_prob, comp\_prob\_freq, comp\_freq\_prob, comp\_freq\_freq (see documentation of comp\_prob\_prob for details).

Visualizations of current probability information are provided by plot\_area, plot\_prism, and plot\_curve.

```

read\_popu 163

read\_popu

Read population data (from df) into a riskyr scenario (description).

# Description

read\_popu reads a data frame df (containing observations of some population that are cross-classified on two binary variables) and returns a scenario of class "riskyr" (i.e., a description of the data).

# Usage

```
read_popu(
    df = popu,
    ix_by_top = 1,
    ix_by_bot = 2,
    ix_sdt = 3,
    hi_lbl = txt$hi_lbl,
    mi_lbl = txt$mi_lbl,
    fa_lbl = txt$fa_lbl,
    cr_lbl = txt$cr_lbl,
    ...
)
```

# Arguments

df	A data frame providing a population popu of individuals, which are identified on at least 2 binary variables and cross-classified into 4 cases in a 3rd variable. Default: df = popu (as data frame).
ix_by_top	Index of variable (column) providing the 1st ( $X/top$ ) perspective (in df). Default: $ix\_by\_top = 1$ (1st column).
ix_by_bot	Index of variable (column) providing the 2nd (Y/bot) perspective (in df). Default: $ix_by_b = 2 (2nd column)$ .
ix_sdt	Index of variable (column) providing a cross-classification into 4 cases (in df). Default: ix_by_bot = 3 (3rd column).
hi_lbl	Label of cases classified as hi (TP).
mi_lbl	Label of cases classified as mi (FN).
fa_lbl	Label of cases classified as fa (FP).
cr_lbl	Label of cases classified as cr (TN).
	Additional parameters (passed to riskyr).

# **Details**

Note that df needs to be structured (cross-classified) according to the data frame popu, created by comp\_popu.

#### Value

An object of class "riskyr" describing a risk-related scenario.

#### See Also

comp\_popu creates data (as df) from description (frequencies); write\_popu creates data (as df) from a riskyr scenario (description); popu for data format; riskyr initializes a riskyr scenario.

Other functions converting data/descriptions: comp\_popu(), write\_popu()

# **Examples**

```
# Generating and interpreting different scenario types:
# (A) Diagnostic/screening scenario (using default labels): -----
popu_diag \leftarrow comp_popu(hi = 4, mi = 1, fa = 2, cr = 3)
# popu_diag
scen_diag <- read_popu(popu_diag, scen_lbl = "Diagnostics", popu_lbl = "Population tested")</pre>
plot(scen_diag, type = "prism", area = "no", f_lbl = "namnum")
# (B) Intervention/treatment scenario: -----
popu_treat <- comp_popu(hi = 80, mi = 20, fa = 45, cr = 55,
                cond_lbl = "Treatment", cond_true_lbl = "pill", cond_false_lbl = "placebo",
                  dec_lbl = "Health status", dec_pos_lbl = "healthy", dec_neg_lbl = "sick")
# popu treat
s_treat <- read_popu(popu_treat, scen_lbl = "Treatment", popu_lbl = "Population treated")</pre>
plot(s_treat, type = "prism", area = "sq", f_lbl = "namnum", p_lbl = "num")
plot(s_treat, type = "icon", lbl_txt = txt_org, col_pal = pal_org)
# (C) Prevention scenario (e.g., vaccination): -----
popu_vacc <- comp_popu(hi = 960, mi = 40, fa = 880, cr = 120,
                   cond_lbl = "Vaccination", cond_true_lbl = "yes", cond_false_lbl = "no",
                       dec_lbl = "Disease", dec_pos_lbl = "no flu", dec_neg_lbl = "flu")
# popu_vacc
s_vacc <- read_popu(popu_vacc, scen_lbl = "Vaccination effects", popu_lbl = "RCT population")</pre>
plot(s_vacc, type = "prism", area = "sq", f_lbl = "namnum", col_pal = pal_rgb, p_lbl = "num")
```

riskyr

Create a riskyr scenario.

# **Description**

riskyr creates a scenario of class "riskyr", which can be visualized by the plot method plot.riskyr and summarized by the summary method summary.riskyr.

# Usage

```
riskyr(
  scen_lbl = txt$scen_lbl,
  popu_lbl = txt$popu_lbl,
 N_1bl = txtN_1bl,
  cond_lbl = txt$cond_lbl,
  cond_true_lbl = txt$cond_true_lbl,
  cond_false_lbl = txt$cond_false_lbl,
  dec_lbl = txt\$dec_lbl,
  dec_pos_lbl = txt$dec_pos_lbl,
  dec_neg_lbl = txt$dec_neg_lbl,

)
```

# Arguments

scen_lbl	The current scenario title (sometimes in Title Caps).
popu_lbl	A brief description of the current population or sample.
N_lbl	A label for the current population popu or sample.
cond_lbl	A label for the <i>condition</i> or feature (e.g., some disease) currently considered.
cond_true_lbl	A label for the <i>presence</i> of the current condition or cond_true cases (the condition's true state of TRUE).
cond_false_lbl	A label for the <i>absence</i> of the current condition or cond_false cases (the condition's true state of FALSE).
dec_lbl	A label for the <i>decision</i> or judgment (e.g., some diagnostic test) currently made.

dec_pos_lbl	A label for <i>positive</i> decisions or dec_pos cases (e.g., predicting the presence of the condition).
dec_neg_lbl	A label for <i>negative</i> decisions or dec_neg cases (e.g., predicting the absence of the condition).
acc_lbl	A label for <i>accuracy</i> (i.e., correspondence between condition and decision or judgment).
dec_cor_lbl	A label for <i>correct</i> (or accurate) decisions or judgments.
dec_err_lbl	A label for <i>incorrect</i> (or erroneous) decisions or judgments.
sdt_lbl	A label for the combination of <i>condition</i> and <i>decision</i> currently made.
hi_lbl	A label for <i>hits</i> or <i>true positives</i> hi (i.e., correct decisions of the presence of the condition, when the condition is actually present).
mi_lbl	A label for <i>misses</i> or <i>false negatives</i> mi (i.e., incorrect decisions of the absence of the condition when the condition is actually present).
fa_lbl	A label for <i>false alarms</i> or <i>false positives</i> fa (i.e., incorrect decisions of the presence of the condition when the condition is actually absent).
cr_lbl	A label for <i>correct rejections</i> or <i>true negatives</i> cr (i.e., a correct decision of the absence of the condition, when the condition is actually absent).
	Essential probabilities:
prev	The condition's prevalence prev (i.e., the probability of condition being TRUE).
sens	The decision's sensitivity sens (i.e., the conditional probability of a positive decision provided that the condition is TRUE). sens is optional when its complement mirt is provided.
spec	The decision's specificity value spec (i.e., the conditional probability of a negative decision provided that the condition is FALSE). spec is optional when its complement fart is provided.
fart	The decision's false alarm rate fart (i.e., the conditional probability of a positive decision provided that the condition is FALSE). fart is optional when its complement spec is provided.  Essential frequencies:
N	The number of individuals in the scenario's population. A suitable value of N is computed, if not provided.
hi	The number of hits hi (or true positives).
mi	The number of misses mi (or false negatives).
fa	The number of false alarms fa (or false positives).
cr	The number of correct rejections <b>cr</b> (or true negatives).  Details and source information:
scen_lng	Language of the current scenario (as character code). Options: "en" for English, "de" for German.
scen_txt	A longer text description of the current scenario (which may extend over several lines).
scen_src	Source information for the current scenario.

scen_apa	Source information for the current scenario according to the American Psychological Association (APA style).
round	Boolean value that determines whether frequency values are rounded to the nearest integer. Default: round = TRUE.  Note: Only rounding when using comp_freq_prob (i.e., computing freq from
	prob description).
sample	Boolean value that determines whether frequency values are sampled from N, given the probability values of prev, sens, and spec. Default: sample = FALSE.
	Note: Only sampling when using comp_freq_prob (i.e., computing freq from prob description).

#### **Format**

An object of class "riskyr" with textual and numeric information describing a risk-related scenario.

#### **Details**

Beyond basic scenario information (i.e., text elements describing a scenario) only the population size N and the essential probabilities prev, sens, spec, and fart are used and returned.

Note:

- Basic text information and some numeric parameters (see num and init\_num) are integral parts of a riskyr scenario.
- By contrast, basic color information (see pal and init\_pal) is not an integral part, but independently defined.
- The names of *probabilities* (see prob) are currently not an integral part of txt and riskyr scenarios (but defined in prob\_lbl\_def and label\_prob).

# Value

An object of class "riskyr" describing a risk-related scenario.

Scenario-specific titles and text labels (see txt).

# See Also

```
init_num and num for basic numeric parameters; init_txt and txt for current text settings;
init_pal and pal for current color settings.
```

```
Other riskyr scenario functions: plot.riskyr(), summary.riskyr()
```

Other functions initializing scenario information: init\_num(), init\_pal(), init\_txt()

# **Examples**

scenarios 169

# Usage

riskyr.guide()

scenarios

A collection of riskyr scenarios from various sources (as list).

## **Description**

scenarios is a list of scenarios of class riskyr collected from the scientific literature and other sources and to be used by visualization and summary functions.

# Usage

scenarios

#### **Format**

A list with currently 25 scenarios of class riskyr which are each described by 21 variables.

# **Details**

scenarios currently contains the following scenarios (n1 to n12 in English language, n13 to n25 in German language):

- 1. Bowel cancer screening
- 2. Cab problem
- 3. Hemoccult test
- 4. Mammography screening
- 5. Mammography (freq)
- 6. Mammography (prob)
- 7. Mushrooms
- 8. Musical town
- 9. PSA test (baseline)
- 10. PSA test (patients)
- 11. Psylicraptis screening
- 12. Sepsis
- 13. Amniozentese (in German language)
- 14. HIV-Test 1
- 15. HIV-Test 2
- 16. HIV-Test 3
- 17. HIV-Test 4
- 18. Mammografie 1

170 scenarios

- 19. Mammografie 2
- 20. Mammografie 3
- 21. Mammografie 4
- 22. Nackenfaltentest (NFT) 1
- 23. Nackenfaltentest (NFT) 2
- 24. Sigmoidoskopie 1
- 25. Sigmoidoskopie 2

#### Variables describing a scenario:

- 1. scen\_lbl: Text label for current scenario.
- 2. scen\_lng: Language of current scenario (en/de).
- 3. scen\_txt: Description text of current scenario.
- 4. popu\_lbl: Text label for current population.
- 5. cond\_lbl: Text label for current condition.
- 6. cond\_true\_lbl: Text label for cond\_true cases.
- 7. cond\_false\_lbl: Text label for cond\_false cases.
- 8. dec\_lbl: Text label for current decision.
- 9. dec\_pos\_lbl: Text label for dec\_pos cases.
- 10. dec\_neg\_lbl: Text label for dec\_neg cases.
- 11. hi\_lbl: Text label for cases of hits hi.
- 12. mi\_lbl: Text label for cases of misses mi.
- 13. fa\_lbl: Text label for cases of false alarms fa.
- 14. cr\_lbl: Text label for cases of correct rejections cr.
- 15. prev: Value of current prevalence prev.
- 16. sens: Value of current sensitivity sens.
- 17. spec: Value of current specificity spec.
- 18. fart: Value of current false alarm rate fart.
- 19. N: Current population size N.
- 20. scen\_src: Source information for current scenario.
- 21. scen\_apa: Source information in APA format.

Note that names of variables (columns) correspond to a subset of init\_txt (to initialize txt) and init\_num (to initialize num).

The variables scen\_src and scen\_apa provide a scenario's source information.

The information of scenarios is also contained in an R data frame df\_scenarios (and generated from the corresponding .rda file in /data/).

# See Also

riskyr initializes a riskyr scenario.

sens 171

sens The sensitivity (or hit rate) of a decision process or diagnostic procedure.

# **Description**

sens defines a decision's sensitivity (or hit rate) value: The conditional probability of the decision being positive if the condition is TRUE.

# Usage

sens

#### **Format**

An object of class numeric of length 1.

#### **Details**

Understanding or obtaining the sensitivity sens (or hit rate HR):

• Definition: sens is the conditional probability for a (correct) positive decision given that the condition is TRUE:

```
sens = p(decision = positive | condition = TRUE)
or the probability of correctly detecting true cases (condition = TRUE).
```

- Perspective: sens further classifies the subset of cond\_true individuals by decision (sens = hi/cond\_true).
- Alternative names: true positive rate (TPR), hit rate (HR), probability of detection, power = 1 beta, recall
- Relationships:

a. sens is the complement of the miss rate mirt (aka. false negative rate FNR or the rate of Type-II errors):

```
sens = (1 - miss rate) = (1 - FNR)
```

b. sens is the opposite conditional probability – but not the complement – of the positive predictive value PPV:

```
PPV = p(condition = TRUE | decision = positive)
```

- In terms of frequencies, sens is the ratio of hi divided by cond\_true (i.e., hi + mi): sens = hi/cond\_true = hi/(hi + mi)
- Dependencies: sens is a feature of a decision process or diagnostic procedure and a measure of correct decisions (true positives).

Due to being a conditional probability, the value of sens is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

# References

Consult Wikipedia for additional information.

172 spec

# See Also

comp\_sens computes sens as the complement of mirt; prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

```
Other probabilities: FDR, FOR, NPV, PPV, acc, err, fart, mirt, ppod, prev, spec
Other essential parameters: cr, fa, hi, mi, prev, spec
```

# **Examples**

```
sens <- .85  # sets a sensitivity value of 85%
sens <- 85/100  # (decision = positive) for 85 out of 100 people with (condition = TRUE)
is_prob(sens)  # TRUE</pre>
```

spec

The specificity of a decision process or diagnostic procedure.

# Description

spec defines a decision's specificity value (or correct rejection rate): The conditional probability of the decision being negative if the condition is FALSE.

# Usage

spec

#### **Format**

An object of class numeric of length 1.

# **Details**

Understanding or obtaining the specificity value spec:

 Definition: spec is the conditional probability for a (correct) negative decision given that the condition is FALSE:

```
spec = p(decision = negative | condition = FALSE)
or the probability of correctly detecting false cases (condition = FALSE).
```

- Perspective: spec further classifies the subset of cond\_false individuals by decision (spec = cr/cond\_false).
- Alternative names: true negative rate (TNR), correct rejection rate, 1 alpha
- Relationships:

```
a. spec is the complement of the false alarm rate fart:spec = 1 - fart
```

b. spec is the opposite conditional probability – but not the complement – of the negative predictive value NPV:

```
NPV = p(condition = FALSE | decision = negative)
```

summary.riskyr 173

- In terms of frequencies, spec is the ratio of cr divided by cond\_false (i.e., fa + cr): spec = cr/cond\_false = cr/(fa + cr)
- Dependencies: spec is a feature of a decision process or diagnostic procedure and a measure of correct decisions (true negatives).

However, due to being a conditional probability, the value of spec is not intrinsic to the decision process, but also depends on the condition's prevalence value prev.

#### References

Consult Wikipedia for additional information.

#### See Also

comp\_spec computes spec as the complement of fart; prob contains current probability information; comp\_prob computes current probability information; num contains basic numeric parameters; init\_num initializes basic numeric parameters; comp\_freq computes current frequency information; is\_prob verifies probabilities.

```
Other probabilities: FDR, FOR, NPV, PPV, acc, err, fart, mirt, ppod, prev, sens
Other essential parameters: cr, fa, hi, mi, prev, sens
```

# **Examples**

```
spec <- .75  # sets a specificity value of 75%  
spec <- 75/100  # (decision = negative) for 75 out of 100 people with (condition = FALSE)  
is_prob(spec)  # TRUE
```

summary.riskyr

Summarize a riskyr scenario.

# Description

summary.riskyr provides a summary method for objects of class "riskyr".

# Usage

```
## S3 method for class 'riskyr'
summary(object = NULL, summarize = "all", ...)
```

## **Arguments**

object	An object of class "riskyr", usually a result of a call to riskyr. Inbuilt scenarios are also of type "riskyr".
summarize	What is summarized as a vector consisting of c("freq", "prob", "accu") for frequencies, probabilities, and accuracy respectively. The default "all" is an alias to all three.
	Additional parameters (to be passed to summary functions).

174 txt

# **Format**

An object of class summary.riskyr with up to 9 entries.

#### Value

A summary list obj. sum with up to 9 entries, dependent on which information is requested by summarize.

Scenario name, relevant condition, and N are summarized by default.

# See Also

```
riskyr initializes a riskyr scenario.

Other riskyr scenario functions: plot.riskyr(), riskyr()
```

# **Examples**

summary(scenarios\$n4)

txt

Basic text elements.

# **Description**

txt is initialized to a list of named elements to define basic scenario titles and labels.

# Usage

txt

# **Format**

An object of class list of length 21.

#### **Details**

All textual elements that specify generic labels and titles of riskyr scenarios are stored as named elements (of type character) in a list txt. To change an element, assign a new character object to an existing name.

The list txt is used throughout the riskyr package unless a scenario defines scenario-specific text labels (when using the riskyr function).

Note:

- Basic text information and some numeric parameters (see num and init\_num) are integral parts of a riskyr scenario.
- By contrast, basic *color* information (see pal and init\_pal) is not an integral part, but independently defined.

txt 175

• The names of *probabilities* (see prob) are currently not an integral part of txt and riskyr scenarios (but defined in prob\_lbl\_def and label\_prob).

txt currently contains the following text labels:

- 1. scen\_lbl The current scenario title (sometimes in Title Caps).
- scen\_txt A longer text description of the current scenario (which may extend over several lines).
- 3. scen\_src The source information for the current scenario.
- 4. scen\_apa The source information in APA format.
- 5. scen\_lng The language of the current scenario (as character code). Options: "en": English, "de": German.
- 6. popu\_1b1 A general name describing the current *population*.
- 7. N\_lbl A short label for the current population popu or sample.
- 8. cond\_lb1 A general name for the *condition* dimension, or the feature (e.g., some disease) currently considered.
- 9. cond\_true\_lbl A short label for the *presence* of the current condition or cond\_true cases (the condition's true state of being TRUE).
- 10. cond\_false\_lbl A short label for the *absence* of the current condition or cond\_false cases (the condition's true state of being FALSE).
- 11. dec\_lb1 A general name for the *decision* dimension, or the judgment (e.g., some diagnostic test) currently made.
- 12. dec\_pos\_lbl A short label for *positive* decisions or dec\_pos cases (e.g., predicting the presence of the condition).
- 13. dec\_neg\_lb1 A short label for *negative* decisions or dec\_neg cases (e.g., predicting the absence of the condition).
- 14. acc\_lbl A general name for the *accuracy* dimension, or the correspondence between the condition currently considered and the decision judgment currently made.
- 15. dec\_cor\_lb1 A short label for *correct* and *accurate* decisions or dec\_cor cases (accurate predictions).
- 16. dec\_err\_lb1 A short label for *incorrect* decisions or dec\_err cases (erroneous predictions).
- 17. sdt\_lbl A general name for all 4 *cases/categories/cells* of the 2x2 contingency table (e.g., condition x decision, using SDT).
- 18. hi\_lbl A short label for *hits* or *true positives* hi/TP cases (i.e., correct decisions of the presence of the condition, when the condition is actually present).
- 19. mi\_lbl A short label for *misses* or *false negatives* mi/FN cases (i.e., incorrect decisions of the absence of the condition when the condition is actually present).
- 20. fa\_lb1 A short label for *false alarms* or *false positives* fa/FP cases (i.e., incorrect decisions of the presence of the condition when the condition is actually absent).
- 21. cr\_lb1 A short label for *correct rejections* or *true negatives* cr/TN cases (i.e., a correct decision of the absence of the condition, when the condition is actually absent).

176 txt\_org

#### See Also

init\_txt initializes text information; riskyr initializes a riskyr scenario; num contains basic
numeric parameters; init\_num initializes basic numeric parameters; pal contains current color
information; init\_pal initializes color information; freq contains current frequency information;
comp\_freq computes current frequency information; prob contains current probability information;
comp\_prob computes current probability information.

Other lists containing current scenario information: accu, freq, num, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_unikn, pal\_vir, pal, prob, txt\_TF, txt\_org

# **Examples**

txt\_org

List of original values of text elements.

# Description

txt\_org is a copy of the initial list of text elements to define all scenario titles and labels.

# Usage

```
txt_org
```

#### **Format**

An object of class list of length 21.

# **Details**

See txt for details and default text information.

Assign txt <- txt\_org to re-set default text labels.

#### See Also

txt contains current text information; init\_txt initializes text information; pal contains current color information; init\_pal initializes color information.

Other lists containing current scenario information: accu, freq, num, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_unikn, pal\_vir, pal, prob, txt\_TF, txt

# **Examples**

```
txt_org  # shows original text labels
txt_org["hi"]  # shows the original label for hits ("hi")
txt_org["hi"] <- "TP" # defines a new label for hits (true positives, TP)</pre>
```

txt\_TF 177

 $txt_TF$ 

Alternative text labels (TP, FN, FP, TN).

# **Description**

txt\_TF is initialized to alternative text labels to define a frequency naming scheme in which (hi, mi, fa, cr) are called (TP, FN, FP, TN).

# Usage

```
txt_TF
```

#### **Format**

An object of class list of length 21.

# **Details**

See txt for details and default text information.

Assign txt <- txt\_TF to use as default text labels.

# See Also

txt contains current text information; init\_txt initializes text information; pal contains current color information; init\_pal initializes color information.

Other lists containing current scenario information: accu, freq, num, pal\_bwp, pal\_bw, pal\_kn, pal\_mbw, pal\_mod, pal\_org, pal\_rgb, pal\_unikn, pal\_vir, pal, prob, txt\_org, txt

# **Examples**

```
txt_TF  # shows text labels of txt_TF
txt_TF["hi"]  # shows the current label for hits ("TP")
txt_TF["hi"] <- "hit"  # defines a new label for hits (true positives, TP)</pre>
```

t\_A

Cumulative risk curve A (main/transfer task A).

#### **Description**

t\_A provides the cumulative risk of some genetic risk factor for developing disease A in some target population as a function of age.

# Usage

t\_A

178 t\_B

# **Format**

```
A data frame (17 x 2). 
age: age (in years). 
  {\tt crisk\_A: cumulative \ risk \ of \ developing \ some \ disease \ A \ in \ the \ target \ population. }
```

# See Also

```
plot_crisk plots cumulative risk curves. Other datasets: BRCA1_mam, BRCA1_ova, BRCA1, BRCA2_mam, BRCA2_ova, BRCA2, df_scenarios, t_B, t_I
```

t\_B

Cumulative risk curve B (main/transfer task B).

# **Description**

t\_B provides the cumulative risk of some genetic risk factor for developing disease B in some target population as a function of age.

# Usage

t\_B

# **Format**

```
A data frame (17 x 2).

age: age (in years).

crisk_B: cumulative risk of developing some disease B in the target population.
```

# See Also

```
plot_crisk plots cumulative risk curves. Other datasets: BRCA1_mam, BRCA1_ova, BRCA1_BRCA2_mam, BRCA2_ova, BRCA2, df_scenarios, t_A, t_I
```

t\_*I* 179

t\_I

Cumulative risk curve I (introductory task).

# Description

t\_I provides the cumulative risk of some genetic risk factor for developing a disease in some target population as a function of age.

# Usage

t\_I

#### **Format**

```
A data frame (17 x 2).

age: age (in years).

crisk_I: cumulative risk of developing some disease in the target population.
```

# See Also

```
plot_crisk plots cumulative risk curves. Other datasets: BRCA1_mam, BRCA1_ova, BRCA1_mam, BRCA1_ova, BRCA2_mam, BRCA2_ova, BRCA2, df_scenarios, t_A, t_B
```

write\_popu

Write a population table (data) from a riskyr scenario (description).

# Description

write\_popu computes (or expands) a table popu (as an R data frame) from a riskyr scenario (description), using its 4 essential frequencies.

# Usage

```
write_popu(x = NULL, ...)
```

#### **Arguments**

```
x A riskyr scenario (description).... Additional parameters (text labels, passed to comp_popu).
```

# Format

```
An object of class data.frame with N rows and 3 columns (e.g., "X/truth/cd", "Y/test/dc", "SDT/cell/class").
```

180 write\_popu

#### **Details**

write\_popu expects a riskyr scenario as input and passes its 4 essential frequencies (rounded to integers) to comp\_popu.

By default, write\_popu uses the text settings contained in txt, but labels can be changed by passing arguments to comp\_popu (via . . . ).

#### Value

A data frame popu containing N rows (individual cases) and 3 columns (e.g., "X/truth/cd", "Y/test/dc", "SDT/cell/class"). encoded as ordered factors (with 2, 2, and 4 levels, respectively).

#### See Also

comp\_popu creates data (as df) from description (frequencies); read\_popu creates a scenario (description) from data (as df); popu for data format; txt for current text settings; riskyr initializes a riskyr scenario.

Other functions converting data/descriptions: comp\_popu(), read\_popu()
