

Package ‘tidyllm’

July 22, 2025

Title Tidy Integration of Large Language Models

Version 0.3.4

Description A tidy interface for integrating large language model (LLM) APIs such as 'Claude', 'Openai', 'Gemini', 'Mistral' and local models via 'Ollama' into R workflows. The package supports text and media-based interactions, interactive message history, batch request APIs, and a tidy, pipeline-oriented interface for streamlined integration into data workflows. Web services are available at <https://www.anthropic.com>, <https://openai.com>, <https://aistudio.google.com/>, <https://mistral.ai/> and <https://ollama.com>.

azure_openai	<i>Azure OpenAI Endpoint Provider Function</i>
--------------	--

Description

The `azure_openai()` function acts as an interface for interacting with the Azure OpenAI API through main `tidyllm` verbs.

Usage

```
azure_openai(..., .called_from = NULL)
```

Arguments

- `...` Parameters to be passed to the Azure OpenAI API specific function, such as model configuration, input text, or API-specific options.
- `.called_from` An internal argument that specifies which action (e.g., `chat`) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Details

`azure_openai()` currently routes messages only to `azure_openai_chat()` when used with `chat()`. `send_batch()`. It dynamically routes requests to OpenAI-specific functions like `azure_openai_chat()` and `azure_openai_embedding()` based on the context of the call.

Value

The result of the requested action, depending on the specific function invoked (currently, only an updated `LLMMessage` object for `azure_openai_chat()`).

azure_openai_chat	<i>Send LLM Messages to an Azure OpenAI Chat Completions endpoint</i>
-------------------	---

Description

This function sends a message history to the Azure OpenAI Chat Completions API and returns the assistant’s reply.

Usage

```

azure_openai_chat(
    .llm,
    .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
    .deployment = "gpt-4o-mini",
    .api_version = "2024-08-01-preview",
    .max_completion_tokens = NULL,
    .reasoning_effort = NULL,
    .frequency_penalty = NULL,
    .logit_bias = NULL,
    .presence_penalty = NULL,
    .seed = NULL,
    .stop = NULL,
    .stream = FALSE,
    .temperature = NULL,
    .top_p = NULL,
    .timeout = 60,
    .verbose = FALSE,
    .json_schema = NULL,
    .max_tries = 3,
    .dry_run = FALSE,
    .logprobs = NULL,
    .top_logprobs = NULL,
    .tools = NULL,
    .tool_choice = NULL
)

```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history.
<code>.endpoint_url</code>	Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
<code>.deployment</code>	The identifier of the model that is deployed (default: "gpt-4o-mini").
<code>.api_version</code>	Which version of the API is deployed (default: "2024-08-01-preview").
<code>.max_completion_tokens</code>	An upper bound for the number of tokens that can be generated for a completion.
<code>.reasoning_effort</code>	How long should reasoning models reason (can either be "low", "medium" or "high").
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
<code>.logit_bias</code>	A named list modifying the likelihood of specified tokens appearing in the completion.
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.

.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.stream	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.timeout	Request timeout in seconds (default: 60).
.verbose	Should additional information be shown after the API call (default: FALSE).
.json_schema	A JSON schema object provided by tidyllm schema or ellmer schemata.
.max_tries	Maximum retries to perform request.
.dry_run	If TRUE, perform a dry run and return the request object (default: FALSE).
.logprobs	If TRUE, get the log probabilities of each output token (default: NULL).
.top_logprobs	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

A new LLMMessage object containing the original messages plus the assistant's response.

azure_openai_embedding

Generate Embeddings Using OpenAI API on Azure

Description

Generate Embeddings Using OpenAI API on Azure

Usage

```

azure_openai_embedding(
  .input,
  .deployment = "text-embedding-3-small",
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .api_version = "2023-05-15",
  .truncate = TRUE,
  .timeout = 120,
  .dry_run = FALSE,
  .max_tries = 3
)

```

Arguments

<code>.input</code>	A character vector of texts to embed or an LLMMessageobject
<code>.deployment</code>	The embedding model identifier (default: "text-embedding-3-small").
<code>.endpoint_url</code>	Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
<code>.api_version</code>	What API-Version othe Azure OpenAI API should be used (default: "2023-05-15")
<code>.truncate</code>	Whether to truncate inputs to fit the model's context length (default: TRUE).
<code>.timeout</code>	Timeout for the API request in seconds (default: 120).
<code>.dry_run</code>	If TRUE, perform a dry run and return the request object.
<code>.max_tries</code>	Maximum retry attempts for requests (default: 3).

Value

A tibble with two columns: `input` and `embeddings`. The `input` column contains the texts sent to embed, and the `embeddings` column is a list column where each row contains an embedding vector of the sent input.

<code>cancel_openai_batch</code>	<i>Cancel an In-Progress OpenAI Batch</i>
----------------------------------	---

Description

This function cancels an in-progress batch created through the OpenAI API. The batch will be moved to a "cancelling" state and, eventually, "cancelled."

Usage

```
cancel_openai_batch(.batch_id, .dry_run = FALSE, .max_tries = 3, .timeout = 60)
```

Arguments

<code>.batch_id</code>	Character; the unique identifier for the batch to cancel.
<code>.dry_run</code>	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
<code>.max_tries</code>	Integer; maximum number of retries if the request fails (default: 3).
<code>.timeout</code>	Integer; request timeout in seconds (default: 60).

Value

A list containing the response from the OpenAI API about the cancellation status.

Description

The `chat()` function sends a message to a language model via a specified provider and returns the response. It routes the provided `LLMMessage` object to the appropriate provider-specific chat function, while allowing for the specification of common arguments applicable across different providers.

Usage

```
chat(
  .llm,
  .provider = getOption("tidyllm_chat_default"),
  .dry_run = NULL,
  .stream = NULL,
  .temperature = NULL,
  .timeout = NULL,
  .top_p = NULL,
  .max_tries = NULL,
  .model = NULL,
  .verbose = NULL,
  .json_schema = NULL,
  .tools = NULL,
  .seed = NULL,
  .stop = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL
)
```

Arguments

<code>.llm</code>	An <code>LLMMessage</code> object containing the message or conversation history to send to the language model.
<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllm_chat_default</code> option.
<code>.dry_run</code>	Logical; if <code>TRUE</code> , simulates the request without sending it to the provider. Useful for testing.
<code>.stream</code>	Logical; if <code>TRUE</code> , streams the response from the provider in real-time.
<code>.temperature</code>	Numeric; controls the randomness of the model's output (0 = deterministic).
<code>.timeout</code>	Numeric; the maximum time (in seconds) to wait for a response.
<code>.top_p</code>	Numeric; nucleus sampling parameter, which limits the sampling to the top cumulative probability <code>p</code> .

<code>.max_tries</code>	Integer; the maximum number of retries for failed requests.
<code>.model</code>	Character; the model identifier to use (e.g., "gpt-4").
<code>.verbose</code>	Logical; if TRUE, prints additional information about the request and response.
<code>.json_schema</code>	List; A JSON schema object as R list to enforce the output structure
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.seed</code>	Integer; sets a random seed for reproducibility.
<code>.stop</code>	Character vector; specifies sequences where the model should stop generating further tokens.
<code>.frequency_penalty</code>	Numeric; adjusts the likelihood of repeating tokens (positive values decrease repetition).
<code>.presence_penalty</code>	Numeric; adjusts the likelihood of introducing new tokens (positive values encourage novelty).

Details

The `chat()` function provides a unified interface for interacting with different language model providers. Common arguments such as `.temperature`, `.model`, and `.stream` are supported by most providers and can be passed directly to `chat()`. If a provider does not support a particular argument, an error will be raised.

Advanced provider-specific configurations can be accessed via the provider functions.

Value

An updated `LLMMessage` object containing the response from the language model.

Examples

```
## Not run:
# Basic usage with OpenAI provider
llm_message("Hello World") |>
  chat(ollama(.ollama_server = "https://my-ollama-server.de"), .model="mixtral")

  chat(mistral, .model="mixtral")

# Use streaming with Claude provider
llm_message("Tell me a story") |>
  chat(claude(), .stream=TRUE)

## End(Not run)
```

chatgpt

Alias for the OpenAI Provider Function

Description

The chatgpt function is an alias for the openai() provider function. It provides a convenient way to interact with the OpenAI API for tasks such as sending chat messages, generating embeddings, and handling batch operations using tidyllm verbs like chat(), embed(), and send_batch().

Usage

```
chatgpt(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or other API-specific options.
.called_from	An internal argument that specifies the context (e.g., chat, embed, send_batch) in which the function is being invoked. This is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LLMMessage object for chat(), or a matrix for embed()).

check_azure_openai_batch

Check Batch Processing Status for Azure OpenAI Batch API

Description

This function retrieves the processing status and other details of a specified Azure OpenAI batch ID from the Azure OpenAI Batch API.

Usage

```
check_azure_openai_batch(
  .llms = NULL,
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .batch_id = NULL,
  .dry_run = FALSE,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects.
<code>.endpoint_url</code>	Base URL for the API (default: <code>Sys.getenv("AZURE_ENDPOINT_URL")</code>).
<code>.batch_id</code>	A manually set batch ID.
<code>.dry_run</code>	Logical; if <code>TRUE</code> , returns the prepared request object without executing it (default: <code>FALSE</code>).
<code>.max_tries</code>	Maximum retries to perform the request (default: 3).
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

<code>check_batch</code>	<i>Check Batch Processing Status</i>
--------------------------	--------------------------------------

Description

This function retrieves the processing status and other details of a specified batchid or a list of `LLMMessage` objects with batch attribute. It routes the input to the appropriate provider-specific batch API function.

Usage

```
check_batch(
  .llms,
  .provider = getOption("tidyllm_cbatch_default"),
  .dry_run = NULL,
  .max_tries = NULL,
  .timeout = NULL
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects or a character vector with a batch ID.
<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllm_cbatch_default</code> option.
<code>.dry_run</code>	Logical; if <code>TRUE</code> , returns the prepared request object without executing it
<code>.max_tries</code>	Maximum retries to perform the request
<code>.timeout</code>	Integer specifying the request timeout in seconds

Value

A tibble with information about the status of batch processing.

check_claude_batch	<i>Check Batch Processing Status for Claude API</i>
--------------------	---

Description

This function retrieves the processing status and other details of a specified Claude batch ID from the Claude API.

Usage

```
check_claude_batch(  
  .llms = NULL,  
  .batch_id = NULL,  
  .api_url = "https://api.anthropic.com/",  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessage objects
.batch_id	A manually set batchid
.api_url	Character; base URL of the Claude API (default: "https://api.anthropic.com/").
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform request
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing

check_groq_batch	<i>Check Batch Processing Status for Groq API</i>
------------------	---

Description

This function retrieves the processing status and other details of a specified Groq batch.

Usage

```
check_groq_batch(  
  .llms = NULL,  
  .batch_id = NULL,  
  .api_url = "https://api.groq.com/",  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessage objects with a batch_id attribute.
.batch_id	A character string with the batch ID to check.
.api_url	Character; base URL of the Groq API (default: "https://api.groq.com/").
.dry_run	Logical; if TRUE, returns the prepared request object without executing (default: FALSE).
.max_tries	Maximum retries to perform request.
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

check_mistral_batch	<i>Check Batch Processing Status for Mistral Batch API</i>
---------------------	--

Description

This function retrieves the processing status and other details of a specified Mistral batch ID from the Mistral Batch API.

Usage

```
check_mistral_batch(  
  .llms = NULL,  
  .batch_id = NULL,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects.
<code>.batch_id</code>	A manually set batch ID.
<code>.dry_run</code>	Logical; if <code>TRUE</code> , returns the prepared request object without executing it (default: <code>FALSE</code>).
<code>.max_tries</code>	Maximum retries to perform the request (default: 3).
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

<code>check_openai_batch</code>	<i>Check Batch Processing Status for OpenAI Batch API</i>
---------------------------------	---

Description

This function retrieves the processing status and other details of a specified OpenAI batch ID from the OpenAI Batch API.

Usage

```
check_openai_batch(
  .llms = NULL,
  .batch_id = NULL,
  .dry_run = FALSE,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects.
<code>.batch_id</code>	A manually set batch ID.
<code>.dry_run</code>	Logical; if <code>TRUE</code> , returns the prepared request object without executing it (default: <code>FALSE</code>).
<code>.max_tries</code>	Maximum retries to perform the request (default: 3).
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

claude*Provider Function for Claude models on the Anthropic API*

Description

The `claude()` function acts as an interface for interacting with the Anthropic API through main `tidyllm` verbs such as `chat()`, `embed()`, and `send_batch()`. It dynamically routes requests to Claude-specific functions like `claude_chat()` and `send_claude_batch()` based on the context of the call.

Usage

```
claude(..., .called_from = NULL)
```

Arguments

<code>...</code>	Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument that specifies which action (e.g., <code>chat</code> , <code>send_batch</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`, or a matrix for `embed()`).

claude_chat*Interact with Claude AI models via the Anthropic API*

Description

Interact with Claude AI models via the Anthropic API

Usage

```
claude_chat(  
  .llm,  
  .model = "claude-3-7-sonnet-20250219",  
  .max_tokens = 2048,  
  .temperature = NULL,  
  .top_k = NULL,  
  .top_p = NULL,  
  .metadata = NULL,  
  .stop_sequences = NULL,
```

```

    .tools = NULL,
    .json_schema = NULL,
    .api_url = "https://api.anthropic.com/",
    .verbose = FALSE,
    .max_tries = 3,
    .timeout = 60,
    .stream = FALSE,
    .dry_run = FALSE,
    .thinking = FALSE,
    .thinking_budget = 1024
)

```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history and system prompt.
<code>.model</code>	Character string specifying the Claude model version (default: "claude-3-5-sonnet-20241022").
<code>.max_tokens</code>	Integer specifying the maximum number of tokens in the response (default: 1024).
<code>.temperature</code>	Numeric between 0 and 1 controlling response randomness.
<code>.top_k</code>	Integer controlling diversity by limiting the top K tokens.
<code>.top_p</code>	Numeric between 0 and 1 for nucleus sampling.
<code>.metadata</code>	List of additional metadata to include with the request.
<code>.stop_sequences</code>	Character vector of sequences that will halt response generation.
<code>.tools</code>	List of additional tools or functions the model can use.
<code>.json_schema</code>	A schema to enforce an output structure
<code>.api_url</code>	Base URL for the Anthropic API (default: "https://api.anthropic.com/").
<code>.verbose</code>	Logical; if TRUE, displays additional information about the API call (default: FALSE).
<code>.max_tries</code>	Maximum retries to perform request
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).
<code>.stream</code>	Logical; if TRUE, streams the response piece by piece (default: FALSE).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
<code>.thinking</code>	Logical; if TRUE, enables Claude's thinking mode for complex reasoning tasks (default: FALSE).
<code>.thinking_budget</code>	Integer specifying the maximum tokens Claude can spend on thinking (default: 1024). Must be at least 1024.

Value

A new LLMMessage object containing the original messages plus Claude's response.

Examples

```
## Not run:
# Basic usage
msg <- llm_message("What is R programming?")
result <- claude_chat(msg)

# With custom parameters
result2 <- claude_chat(msg,
  .temperature = 0.7,
  .max_tokens = 1000)

## End(Not run)
```

claude_list_models	<i>List Available Models from the Anthropic Claude API</i>
--------------------	--

Description

List Available Models from the Anthropic Claude API

Usage

```
claude_list_models(
  .api_url = "https://api.anthropic.com",
  .timeout = 60,
  .max_tries = 3,
  .dry_run = FALSE,
  .verbose = FALSE
)
```

Arguments

.api_url	Base URL for the API (default: "https://api.anthropic.com").
.timeout	Request timeout in seconds (default: 60).
.max_tries	Maximum number of retries for the API request (default: 3).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it.
.verbose	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include type, id, display_name, and created_at), or NULL if no models are found.

deepseek	<i>Deepseek Provider Function</i>
----------	-----------------------------------

Description

The `deepseek()` function acts as a provider interface for interacting with the Deepseek API through `tidyllm`'s `chat()` verb. It dynamically routes requests to deepseek-specific function. At the moment this is only `deepseek_chat()`

Usage

```
deepseek(..., .called_from = NULL)
```

Arguments

<code>...</code>	Parameters to be passed to the appropriate Deepseek-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument specifying which action (e.g., <code>chat</code> , <code>embed</code>) the function is invoked from. This argument is automatically managed by the <code>tidyllm</code> verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`).

deepseek_chat	<i>Send LLM Messages to the DeepSeek Chat API</i>
---------------	---

Description

This function sends a message history to the DeepSeek Chat API and returns the assistant's reply. Currently tool calls cause problems on the DeepSeek API

Usage

```
deepseek_chat(
  .llm,
  .model = "deepseek-chat",
  .max_tokens = 2048,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
```

```

        .stream = FALSE,
        .logprobs = NULL,
        .top_logprobs = NULL,
        .tools = NULL,
        .tool_choice = NULL,
        .api_url = "https://api.deepseek.com/",
        .timeout = 60,
        .verbose = FALSE,
        .dry_run = FALSE,
        .max_tries = 3
    )

```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history.
<code>.model</code>	The identifier of the model to use (default: "deepseek-chat").
<code>.max_tokens</code>	The maximum number of tokens that can be generated in the response (default: 2048).
<code>.temperature</code>	Controls the randomness in the model's response. Values between 0 and 2 are allowed (optional).
<code>.top_p</code>	Nucleus sampling parameter that controls the proportion of probability mass considered (optional).
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Penalizes repeated tokens to reduce repetition (optional).
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Encourages new topics by penalizing tokens that have appeared so far (optional).
<code>.stop</code>	One or more sequences where the API will stop generating further tokens (optional).
<code>.stream</code>	Logical; if TRUE, streams the response piece by piece (default: FALSE).
<code>.logprobs</code>	If TRUE, returns log probabilities of each output token (default: FALSE).
<code>.top_logprobs</code>	Number between 0 and 5 specifying the number of top log probabilities to return (optional).
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.tool_choice</code>	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required" (optional).
<code>.api_url</code>	Base URL for the DeepSeek API (default: "https://api.deepseek.com/").
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.verbose</code>	If TRUE, displays additional information after the API call (default: FALSE).
<code>.dry_run</code>	If TRUE, returns the constructed request object without executing it (default: FALSE).
<code>.max_tries</code>	Maximum retries to perform the request (default: 3).

Value

A new LLMMessage object containing the original messages plus the assistant’s response.

df_llm_message	<i>Convert a Data Frame to an LLMMessage Object</i>
----------------	---

Description

This function converts a data frame into an LLMMessage object representing a conversation history. The data frame must have specific columns (role and content), with each row representing a message.

Usage

```
df_llm_message(.df)
```

Arguments

.df A data frame with at least two rows and columns role and content. The role column should contain "user", "assistant", or "system". The content column should contain the corresponding message text.

Value

An LLMMessage object representing the structured conversation.

See Also

[llm_message\(\)](#)
Other Message Creation Utilities: [llm_message\(\)](#)

embed	<i>Generate text embeddings</i>
-------	---------------------------------

Description

The embed() function allows you to embed a text via a specified provider. It routes the input to the appropriate provider-specific embedding function.

Usage

```
embed(
  .input,
  .provider = getOption("tidyllm_embed_default"),
  .model = NULL,
  .truncate = NULL,
  .timeout = NULL,
  .dry_run = NULL,
  .max_tries = NULL
)
```

Arguments

<code>.input</code>	A character vector of texts <code>v</code> , a list of texts and image objects, or an <code>LLMMessage</code> object
<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>ollama()</code> , etc. You can also set a default provider function via the <code>tidyllm_embed_default</code> option.
<code>.model</code>	The embedding model to use
<code>.truncate</code>	Whether to truncate inputs to fit the model's context length
<code>.timeout</code>	Timeout for the API request in seconds
<code>.dry_run</code>	If <code>TRUE</code> , perform a dry run and return the request object.
<code>.max_tries</code>	Maximum retry attempts for requests

Value

A tibble with two columns: `input` and `embeddings`. The `input` column contains the texts sent to `embed`, and the `embeddings` column is a list column where each row contains an embedding vector of the sent input.

Examples

```
## Not run:
c("What is the meaning of life, the universe and everything?",
  "How much wood would a woodchuck chuck?",
  "How does the brain work?") |>
  embed(gemini)

## End(Not run)
```

`fetch_azure_openai_batch`*Fetch Results for an Azure OpenAI Batch*

Description

This function retrieves the results of a completed Azure OpenAI batch and updates the provided list of `LLMMessage` objects with the responses. It aligns each response with the original request using the `custom_ids` generated in `send_azure_openai_batch()`.

Usage

```
fetch_azure_openai_batch(  
    .llms,  
    .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),  
    .batch_id = NULL,  
    .dry_run = FALSE,  
    .max_tries = 3,  
    .timeout = 60  
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects that were part of the batch.
<code>.endpoint_url</code>	Base URL for the API (default: <code>Sys.getenv("AZURE_ENDPOINT_URL")</code>).
<code>.batch_id</code>	Character; the unique identifier for the batch. By default this is <code>NULL</code> and the function will attempt to use the <code>batch_id</code> attribute from <code>.llms</code> .
<code>.dry_run</code>	Logical; if <code>TRUE</code> , returns the constructed request without executing it (default: <code>FALSE</code>).
<code>.max_tries</code>	Integer; maximum number of retries if the request fails (default: 3).
<code>.timeout</code>	Integer; request timeout in seconds (default: 60).

Value

A list of updated `LLMMessage` objects, each with the assistant's response added if successful.

fetch_batch	<i>Fetch Results from a Batch API</i>
-------------	---------------------------------------

Description

This function retrieves the results of a completed batch and updates the provided list of LLMMessage objects with the responses. It aligns each response with the original request using the custom_ids generated in send_batch().

Usage

```
fetch_batch(  
  .llms,  
  .provider = getOption("tidyllm_fbatch_default"),  
  .dry_run = NULL,  
  .max_tries = NULL,  
  .timeout = NULL  
)
```

Arguments

.llms	A list of LLMMessage objects containing conversation histories.
.provider	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like openai(), claude(), etc. You can also set a default provider function via the tidyllm_fbatch_default option.
.dry_run	Logical; if TRUE, returns the constructed request without executing it
.max_tries	Integer; maximum number of retries if the request fails
.timeout	Integer; request timeout in seconds

Details

The function routes the input to the appropriate provider-specific batch API function.

Value

A list of updated LLMMessage objects, each with the assistant’s response added if successful.

fetch_claude_batch	<i>Fetch Results for a Claude Batch</i>
--------------------	---

Description

This function retrieves the results of a completed Claude batch and updates the provided list of LLMMessage objects with the responses. It aligns each response with the original request using the custom_ids generated in send_claude_batch().

Usage

```
fetch_claude_batch(  
    .llms,  
    .batch_id = NULL,  
    .api_url = "https://api.anthropic.com/",  
    .dry_run = FALSE,  
    .max_tries = 3,  
    .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessage objects that were part of the batch. The list should have names (custom IDs) set by send_claude_batch() to ensure correct alignment.
.batch_id	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the batch_id attribute from .llms.
.api_url	Character; the base URL for the Claude API (default: "https://api.anthropic.com/").
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessage objects, each with the assistant's response added if successful.

fetch_groq_batch	<i>Fetch Results for a Groq Batch</i>
------------------	---------------------------------------

Description

This function retrieves the results of a completed Groq batch and updates the provided list of LLMMessage objects with the responses.

Usage

```
fetch_groq_batch(  
    .llms,  
    .batch_id = NULL,  
    .api_url = "https://api.groq.com/",  
    .dry_run = FALSE,  
    .max_tries = 3,  
    .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessage objects that were part of the batch.
.batch_id	Character; the unique identifier for the batch.
.api_url	Character; the base URL for the Groq API (default: "https://api.groq.com/").
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessage objects, each with the assistant’s response added if successful.

fetch_mistral_batch	<i>Fetch Results for an Mistral Batch</i>
---------------------	---

Description

This function retrieves the results of a completed Mistral batch and updates the provided list of LLMMessage objects with the responses. It aligns each response with the original request using the custom_ids generated in send_mistral_batch().

Usage

```

fetch_mistral_batch(
    .llms,
    .batch_id = NULL,
    .dry_run = FALSE,
    .max_tries = 3,
    .timeout = 60
)

```

Arguments

<code>.llms</code>	A list of LLMMessage objects that were part of the batch.
<code>.batch_id</code>	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the <code>batch_id</code> attribute from <code>.llms</code> .
<code>.dry_run</code>	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
<code>.max_tries</code>	Integer; maximum number of retries if the request fails (default: 3).
<code>.timeout</code>	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessage objects, each with the assistant's response added if successful.

<code>fetch_openai_batch</code>	<i>Fetch Results for an OpenAI Batch</i>
---------------------------------	--

Description

This function retrieves the results of a completed OpenAI batch and updates the provided list of LLMMessage objects with the responses. It aligns each response with the original request using the `custom_ids` generated in `send_openai_batch()`.

Usage

```

fetch_openai_batch(
    .llms,
    .batch_id = NULL,
    .dry_run = FALSE,
    .max_tries = 3,
    .timeout = 60
)

```

Arguments

.llms	A list of LLMMessage objects that were part of the batch.
.batch_id	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the batch_id attribute from .llms.
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessage objects, each with the assistant's response added if successful.

field_chr	<i>Define Field Descriptors for JSON Schema</i>
-----------	---

Description

These functions create field descriptors used in tidyllm_schema() or field_object() to define JSON schema fields. They support character, factor, numeric, and logical types.

Usage

```
field_chr(.description = character(0), .vector = FALSE)

field_fct(.description = character(0), .levels, .vector = FALSE)

field_dbl(.description = character(0), .vector = FALSE)

field_lgl(.description = character(0), .vector = FALSE)
```

Arguments

.description	A character string describing the field (optional).
.vector	A logical value indicating if the field is a vector (default: FALSE).
.levels	A character vector specifying allowable values (for field_fct() only).

Value

An S7 tidyllm_field object representing the field descriptor.

Examples

```
field_chr("A common street name")
field_fct("State abbreviation", .levels = c("CA", "TX", "Other"))
field_dbl("House number")
field_lgl("Is residential")
field_dbl("A list of apartment numbers at the address", .vector=TRUE )
```

field_object	<i>Define a nested object field</i>
--------------	-------------------------------------

Description

Define a nested object field

Usage

```
field_object(.description = character(0), ..., .vector = FALSE)
```

Arguments

.description	A character string describing the field (optional).
...	Named fields to include in the object definition (required).
.vector	A logical value indicating if the field is a list of objects (default: FALSE).

Value

An S7 tidyllm_field object of type "object" containing nested fields.

Examples

```
# Define an address object with nested fields
address <- field_object("A mailing address",
  street = field_chr("Street name"),
  city = field_chr("City name"),
  zipcode = field_chr("Postal code")
)

# Create a vector of objects
addresses <- field_object("List of addresses",
  street = field_chr("Street name"),
  city = field_chr("City name"),
  .vector = TRUE
)
```

gemini	<i>Google Gemini Provider Function</i>
--------	--

Description

The gemini() function acts as a provider interface for interacting with the Google Gemini API through tidyllm's main verbs such as chat() and embed(). It dynamically routes requests to Gemini-specific functions like gemini_chat() and gemini_embedding() based on the context of the call.

Usage

```
gemini(..., .called_from = NULL)
```

Arguments

- ... Parameters to be passed to the appropriate Gemini-specific function, such as model configuration, input text, or API-specific options.
- .called_from An internal argument specifying which action (e.g., chat, embed) the function is invoked from. This argument is automatically managed by the tidyllm verbs and should not be modified by the user.

Details

Some functions, such as `gemini_upload_file()` and `gemini_delete_file()`, are specific to Gemini and do not have general verb counterparts.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`).

gemini_chat	<i>Send LLMMessage to Gemini API</i>
-------------	--------------------------------------

Description

Send LLMMessage to Gemini API

Usage

```
gemini_chat(  
  .llm,  
  .model = "gemini-2.0-flash",  
  .fileid = NULL,  
  .temperature = NULL,  
  .max_output_tokens = NULL,  
  .top_p = NULL,  
  .top_k = NULL,  
  .grounding_threshold = NULL,  
  .presence_penalty = NULL,  
  .frequency_penalty = NULL,  
  .stop_sequences = NULL,  
  .safety_settings = NULL,  
  .json_schema = NULL,  
  .tools = NULL,  
  .timeout = 120,  
  .dry_run = FALSE,  
)
```

```
.max_tries = 3,
.verbose = FALSE,
.stream = FALSE
)
```

Arguments

<code>.llm</code>	An existing LLMMessage object or an initial text prompt.
<code>.model</code>	The model identifier (default: "gemini-1.5-flash").
<code>.fileid</code>	Optional vector of file IDs uploaded via <code>gemini_upload_file()</code> (default: NULL).
<code>.temperature</code>	Controls randomness in generation (default: NULL, range: 0.0-2.0).
<code>.max_output_tokens</code>	Maximum tokens in the response (default: NULL).
<code>.top_p</code>	Controls nucleus sampling (default: NULL, range: 0.0-1.0).
<code>.top_k</code>	Controls diversity in token selection (default: NULL, range: 0 or more).
<code>.grounding_threshold</code>	A grounding threshold between 0 and 1. With lower grounding thresholds Gemini will use Google to search for relevant information before answering. (default: NULL).
<code>.presence_penalty</code>	Penalizes new tokens (default: NULL, range: -2.0 to 2.0).
<code>.frequency_penalty</code>	Penalizes frequent tokens (default: NULL, range: -2.0 to 2.0).
<code>.stop_sequences</code>	Optional character sequences to stop generation (default: NULL, up to 5).
<code>.safety_settings</code>	A list of safety settings (default: NULL).
<code>.json_schema</code>	A schema to enforce an output structure
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.timeout</code>	When should our connection time out (default: 120 seconds).
<code>.dry_run</code>	If TRUE, perform a dry run and return the request object.
<code>.max_tries</code>	Maximum retries to perform request (default: 3).
<code>.verbose</code>	Should additional information be shown after the API call.
<code>.stream</code>	Should the response be streamed (default: FALSE).

Value

A new LLMMessage object containing the original messages plus the assistant's response.

gemini_delete_file	<i>Delete a File from Gemini API</i>
--------------------	--------------------------------------

Description

Deletes a specific file from the Gemini API using its file ID.

Usage

```
gemini_delete_file(.file_name)
```

Arguments

.file_name	The file ID (e.g., "files/abc-123") to delete.
------------	--

Value

Invisibly returns NULL. Prints a confirmation message upon successful deletion.

gemini_embedding	<i>Generate Embeddings Using the Google Gemini API</i>
------------------	--

Description

Generate Embeddings Using the Google Gemini API

Usage

```
gemini_embedding(  
  .input,  
  .model = "text-embedding-004",  
  .truncate = TRUE,  
  .timeout = 120,  
  .dry_run = FALSE,  
  .max_tries = 3  
)
```

Arguments

.input	A character vector of texts to embed or an LLMMessage object
.model	The embedding model identifier (default: "text-embedding-3-small").
.truncate	Whether to truncate inputs to fit the model's context length (default: TRUE).
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests (default: 3).

Value

A matrix where each column corresponds to the embedding of a message in the message history.

<code>gemini_file_metadata</code>	<i>Retrieve Metadata for a File from Gemini API</i>
-----------------------------------	---

Description

Retrieves metadata for a specific file uploaded to the Gemini API.

Usage

```
gemini_file_metadata(.file_name)
```

Arguments

`.file_name` The file ID (e.g., "files/abc-123") to retrieve metadata for.

Value

A tibble containing metadata fields such as name, display name, MIME type, size, and URI.

<code>gemini_list_files</code>	<i>List Files in Gemini API</i>
--------------------------------	---------------------------------

Description

Lists metadata for files uploaded to the Gemini API, supporting pagination.

Usage

```
gemini_list_files(.page_size = 10, .page_token = NULL)
```

Arguments

`.page_size` The maximum number of files to return per page (default: 10, maximum: 100).
`.page_token` A token for fetching the next page of results (default: NULL).

Value

A tibble containing metadata for each file, including fields such as name, display name, MIME type, and URI.

gemini_upload_file	<i>Upload a File to Gemini API</i>
--------------------	------------------------------------

Description

Uploads a file to the Gemini API and returns its metadata as a tibble.

Usage

```
gemini_upload_file(.file_path)
```

Arguments

`.file_path` The local file path of the file to upload.

Value

A tibble containing metadata about the uploaded file, including its name, URI, and MIME type.

get_logprobs	<i>Retrieve Log Probabilities from Assistant Replies</i>
--------------	--

Description

Extracts token log probabilities from assistant replies within an `LLMMessage` object. Each row represents a token with its log probability and top alternative tokens.

Usage

```
get_logprobs(.llm, .index = NULL)
```

Arguments

`.llm` An `LLMMessage` object containing the message history.

`.index` A positive integer specifying which assistant reply's log probabilities to extract. If `NULL` (default), log probabilities for all replies are returned.

Details

An empty tibble is output if no logprobs were requested. Currently only works with `openai_chat()`

Columns include:

- `reply_index`: The index of the assistant reply in the message history.
- `token`: The generated token.
- `logprob`: The log probability of the generated token.
- `bytes`: The byte-level encoding of the token.
- `top_logprobs`: A list column containing the top alternative tokens with their log probabilities.

Value

A tibble containing log probabilities for the specified assistant reply or all replies.

See Also

[get_metadata\(\)](#)

get_metadata	<i>Retrieve Metadata from Assistant Replies</i>
--------------	---

Description

Retrieves metadata from assistant replies within an LLMMessage object. It returns the metadata as a tibble.

Usage

```
get_metadata(.llm, .index = NULL)
```

```
last_metadata(.llm)
```

Arguments

.llm	An LLMMessage object containing the message history.
.index	A positive integer specifying which assistant reply's metadata to extract. If NULL (default), metadata for all replies is returned.

Details

Metadata columns may include:

- model: The model used for generating the reply.
- timestamp: The time when the reply was generated.
- prompt_tokens: The number of tokens in the input prompt.
- completion_tokens: The number of tokens in the assistant's reply.
- total_tokens: The total number of tokens (prompt + completion).
- api_specific: A list column with API-specific metadata.

For convenience, [last_metadata\(\)](#) is provided to retrieve the metadata for the last message.

Value

A tibble containing metadata for the specified assistant reply or all replies.

See Also

[last_metadata\(\)](#)

get_reply	<i>Retrieve Assistant Reply as Text</i>
-----------	---

Description

Extracts the plain text content of the assistant's reply from an LLMMessage object. Use [get_reply_data\(\)](#) for structured replies in JSON format.

Usage

```
get_reply(.llm, .index = NULL)
```

```
last_reply(.llm)
```

Arguments

.llm	An LLMMessage object containing the message history.
.index	A positive integer indicating the index of the assistant reply to retrieve. Defaults to NULL, which retrieves the last reply.

Details

This function is the core utility for retrieving assistant replies by index. For convenience, [last_reply\(\)](#) is provided as a wrapper to retrieve the latest assistant reply.

Value

Returns a character string containing the assistant's reply, or NA_character_ if no reply exists.

See Also

[get_reply_data\(\)](#), [last_reply\(\)](#)

get_reply_data	<i>Retrieve Assistant Reply as Structured Data</i>
----------------	--

Description

Parses the assistant's reply as JSON and returns the corresponding structured data. If the reply is not marked as JSON, attempts to extract and parse JSON content from the text.

Usage

```
get_reply_data(.llm, .index = NULL)
```

```
last_reply_data(.llm)
```

Arguments

- .llm An LLMMessage object containing the message history.
- .index A positive integer indicating the index of the assistant reply to retrieve. Defaults to NULL, which retrieves the last reply.

Details

For convenience, [last_reply_data\(\)](#) is provided as a wrapper to retrieve the latest assistant reply’s data.

Value

Returns the parsed data from the assistant’s reply, or NULL if parsing fails.

See Also

[get_reply\(\)](#), [last_reply_data\(\)](#)

get_user_message	<i>Retrieve a User Message by Index</i>
------------------	---

Description

Extracts the content of a user’s message from an LLMMessage object at a specific index.

Usage

```
get_user_message(.llm, .index = NULL)

last_user_message(.llm)
```

Arguments

- .llm An LLMMessage object.
- .index A positive integer indicating which user message to retrieve. Defaults to NULL, which retrieves the last message.

Details

For convenience, [last_user_message\(\)](#) is provided as a wrapper to retrieve the latest user message without specifying an index.

Value

Returns the content of the user’s message at the specified index. If no messages are found, returns NA_character_.

See Also

[last_user_message\(\)](#)

groq	<i>Groq API Provider Function</i>
------	-----------------------------------

Description

The `groq()` function acts as an interface for interacting with the Groq API through `tidyllm`'s main verbs. Currently, Groq only supports `groq_chat()` for chat-based interactions and `groq_transcribe()` for transcription tasks.

Usage

```
groq(..., .called_from = NULL)
```

Arguments

- | | |
|--------------|--|
| ... | Parameters to be passed to the Groq-specific function, such as model configuration, input text, or API-specific options. |
| .called_from | An internal argument that specifies which action (e.g., <code>chat</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user. |

Details

Since `groq_transcribe()` is unique to Groq and does not have a general verb counterpart, `groq()` currently routes messages only to `groq_chat()` when used with verbs like `chat()`.

Value

The result of the requested action, depending on the specific function invoked (currently, only an updated `LLMMessage` object for `groq_chat()`).

groq_chat	<i>Send LLM Messages to the Groq Chat API</i>
-----------	---

Description

This function sends a message history to the Groq Chat API and returns the assistant's reply.

Usage

```

groq_chat(
  .llm,
  .model = "deepseek-r1-distill-llama-70b",
  .max_tokens = 1024,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
  .seed = NULL,
  .tools = NULL,
  .tool_choice = NULL,
  .api_url = "https://api.groq.com/",
  .json = FALSE,
  .timeout = 60,
  .verbose = FALSE,
  .stream = FALSE,
  .dry_run = FALSE,
  .max_tries = 3
)

```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history.
<code>.model</code>	The identifier of the model to use (default: "llama-3.2-11b-vision-preview").
<code>.max_tokens</code>	The maximum number of tokens that can be generated in the response (default: 1024).
<code>.temperature</code>	Controls the randomness in the model's response. Values between 0 and 2 are allowed, where higher values increase randomness (optional).
<code>.top_p</code>	Nucleus sampling parameter that controls the proportion of probability mass considered. Values between 0 and 1 are allowed (optional).
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize repeated tokens, reducing likelihood of repetition (optional).
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values encourage new topics by penalizing tokens that have appeared so far (optional).
<code>.stop</code>	One or more sequences where the API will stop generating further tokens. Can be a string or a list of strings (optional).
<code>.seed</code>	An integer for deterministic sampling. If specified, attempts to return the same result for repeated requests with identical parameters (optional).
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls (optional).
<code>.tool_choice</code>	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required" (optional).

<code>.api_url</code>	Base URL for the Groq API (default: "https://api.groq.com/").
<code>.json</code>	Whether the response should be structured as JSON (default: FALSE).
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.verbose</code>	If TRUE, displays additional information after the API call, including rate limit details (default: FALSE).
<code>.stream</code>	Logical; if TRUE, streams the response piece by piece (default: FALSE).
<code>.dry_run</code>	If TRUE, performs a dry run and returns the constructed request object without executing it (default: FALSE).
<code>.max_tries</code>	Maximum retries to perform request

Value

A new LLMMessage object containing the original messages plus the assistant's response.

Examples

```
## Not run:
# Basic usage
msg <- llm_message("What is Groq?")
result <- groq_chat(msg)

# With custom parameters
result2 <- groq_chat(msg,
  .model = "llama-3.2-vision",
  .temperature = 0.5,
  .max_tokens = 512)

## End(Not run)
```

groq_list_models

List Available Models from the Groq API

Description

List Available Models from the Groq API

Usage

```
groq_list_models(
  .api_url = "https://api.groq.com",
  .timeout = 60,
  .max_tries = 3,
  .dry_run = FALSE,
  .verbose = FALSE
)
```

Arguments

<code>.api_url</code>	Base URL for the API (default: "https://api.groq.com").
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.max_tries</code>	Maximum number of retries for the API request (default: 3).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it.
<code>.verbose</code>	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include `id`, `created`, `owned_by`, and `context_window`), or NULL if no models are found.

groq_transcribe	<i>Transcribe an Audio File Using Groq transcription API</i>
-----------------	--

Description

This function reads an audio file and sends it to the Groq transcription API for transcription.

Usage

```
groq_transcribe(
  .audio_file,
  .model = "whisper-large-v3",
  .language = NULL,
  .prompt = NULL,
  .temperature = 0,
  .api_url = "https://api.groq.com/openai/v1/audio/transcriptions",
  .dry_run = FALSE,
  .verbose = FALSE,
  .max_tries = 3
)
```

Arguments

<code>.audio_file</code>	The path to the audio file (required). Supported formats include flac, mp3, mp4, mpeg, mpga, m4a, ogg, wav, or webm.
<code>.model</code>	The model to use for transcription (default: "whisper-large-v3").
<code>.language</code>	The language of the input audio, in ISO-639-1 format (optional).
<code>.prompt</code>	A prompt to guide the transcription style. It should match the audio language (optional).
<code>.temperature</code>	Sampling temperature, between 0 and 1, with higher values producing more randomness (default: 0).
<code>.api_url</code>	Base URL for the API (default: "https://api.groq.com/openai/v1/audio/transcriptions").

<code>.dry_run</code>	Logical; if TRUE, performs a dry run and returns the request object without making the API call (default: FALSE).
<code>.verbose</code>	Logical; if TRUE, rate limiting info is displayed after the API request (default: FALSE).
<code>.max_tries</code>	Maximum retries to perform request

Value

A character vector containing the transcription.

Examples

```
## Not run:  
# Basic usage  
groq_transcribe(.audio_file = "example.mp3")  
  
## End(Not run)
```

`img`*Create an Image Object*

Description

This function reads an image file from disk, encodes it in base64, and returns a `tidyllm_image` object that can be used in multimodal embedding requests.

Usage

```
img(.path)
```

Arguments

<code>.path</code>	The path to the image file on disk.
--------------------	-------------------------------------

Value

An `tidyllm_image`, containing:

- `imagepath`: The original file path
- `imagename`: The basename of the image
- `imagebase64`: a "data:image/...;base64,..." string

```
list_azure_openai_batches
```

List Azure OpenAI Batch Requests

Description

Retrieves batch request details from the Azure OpenAI Batch API.

Usage

```
list_azure_openai_batches(
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .limit = 20,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

<code>.endpoint_url</code>	Base URL for the API (default: <code>Sys.getenv("AZURE_ENDPOINT_URL")</code>).
<code>.limit</code>	Maximum number of batches to retrieve (default: 20).
<code>.max_tries</code>	Maximum retry attempts for requests (default: 3).
<code>.timeout</code>	Request timeout in seconds (default: 60).

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (total, completed, failed).

```
list_batches
```

List all Batch Requests on a Batch API

Description

List all Batch Requests on a Batch API

Usage

```
list_batches(.provider = getOption("tidyllm_lbatch_default"))
```

Arguments

<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllm_lbatch_default</code> option.
------------------------	---

Value

A tibble with information about the status of batch processing.

list_claude_batches	<i>List Claude Batch Requests</i>
---------------------	-----------------------------------

Description

Retrieves batch request details from the Claude API.

Usage

```
list_claude_batches(  
  .api_url = "https://api.anthropic.com/",  
  .limit = 20,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.api_url	Base URL for the Claude API (default: "https://api.anthropic.com/").
.limit	Maximum number of batches to retrieve (default: 20).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (succeeded, errored, expired, canceled).

list_groq_batches	<i>List Groq Batch Requests</i>
-------------------	---------------------------------

Description

Retrieves batch request details from the Groq API.

Usage

```
list_groq_batches(  
  .api_url = "https://api.groq.com/",  
  .limit = 20,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.api_url	Base URL for the Groq API (default: "https://api.groq.com/").
.limit	Maximum number of batches to retrieve (default: 20).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).

Value

A tibble with batch details including batch ID, status, creation time, and request counts.

list_mistral_batches	<i>List Mistral Batch Requests</i>
----------------------	------------------------------------

Description

Retrieves batch request details from the OpenAI Batch API.

Usage

```
list_mistral_batches(  
  .limit = 100,  
  .max_tries = 3,  
  .timeout = 60,  
  .status = NULL,  
  .created_after = NULL  
)
```

Arguments

.limit	Maximum number of batches to retrieve (default: 20).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).
.status	Filter by status. (default: NULL)
.created_after	created after a string specifying a date-time (default: NULL)

Value

A tibble with batch details for all batches fitting the request

list_models	<i>List Available Models for a Provider</i>
-------------	---

Description

The `list_models()` function retrieves available models from the specified provider.

Usage

```
list_models(.provider = getOption("tidyllm_lmodels_default"), ...)
```

Arguments

<code>.provider</code>	A function or function call specifying the provider and any additional parameters. You can also set a default provider via the <code>tidyllm_lmodels_default</code> option.
<code>...</code>	Additional arguments to be passed to the provider-specific <code>list_models</code> function.

Value

A tibble containing model information.

list_openai_batches	<i>List OpenAI Batch Requests</i>
---------------------	-----------------------------------

Description

Retrieves batch request details from the OpenAI Batch API.

Usage

```
list_openai_batches(.limit = 20, .max_tries = 3, .timeout = 60)
```

Arguments

<code>.limit</code>	Maximum number of batches to retrieve (default: 20).
<code>.max_tries</code>	Maximum retry attempts for requests (default: 3).
<code>.timeout</code>	Request timeout in seconds (default: 60).

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (total, completed, failed).

LLMMessage	<i>Large Language Model Message Class</i>
------------	---

Description

LLMMessage is an S7 class for managing a conversation history intended for use with large language models (LLMs). Please use llm_message() to create or modify LLMMessage objects.

Usage

```
LLMMessage(message_history = list(), system_prompt = character(0))
```

Arguments

message_history	A list containing messages. Each message is a named list with keys like role, content, media, etc.
system_prompt	A character string representing the default system prompt used for the conversation.

Details

- The LLMMessage class includes the following features:
- Stores message history in a structured format.
 - Supports attaching media and metadata to messages.
 - Provides generics like add_message(), has_image(), and remove_message() for interaction.
 - Enables API-specific formatting through the to_api_format() generic.
 - message_history: A list containing messages. Each message is a named list with keys like role, content, media, etc.
 - system_prompt: A character string representing the default system prompt used for the conversation.

llm_message	<i>Create or Update Large Language Model Message Object</i>
-------------	---

Description

This function creates a new LLMMessage object or updates an existing one. It supports adding text prompts and various media types, such as images, PDFs, text files, or plots.

Usage

```
llm_message(  
  .llm = NULL,  
  .prompt = NULL,  
  .role = "user",  
  .system_prompt = "You are a helpful assistant",  
  .imagefile = NULL,  
  .pdf = NULL,  
  .textfile = NULL,  
  .capture_plot = FALSE,  
  .f = NULL  
)
```

Arguments

<code>.llm</code>	An existing <code>LLMMessage</code> object or an initial text prompt.
<code>.prompt</code>	Text prompt to add to the message history.
<code>.role</code>	The role of the message sender, typically "user" or "assistant".
<code>.system_prompt</code>	Default system prompt if a new <code>LLMMessage</code> needs to be created.
<code>.imagefile</code>	Path to an image file to be attached (optional).
<code>.pdf</code>	Path to a PDF file to be attached (optional). Can be a character vector of length one (file path), or a list with <code>filename</code> , <code>start_page</code> , and <code>end_page</code> .
<code>.textfile</code>	Path to a text file to be read and attached (optional).
<code>.capture_plot</code>	Boolean to indicate whether a plot should be captured and attached as an image (optional).
<code>.f</code>	An R function or an object coercible to a function via <code>rlang::as_function</code> , whose output should be captured and attached (optional).

Value

Returns an updated or new `LLMMessage` object.

Other Message Creation Utilities: [df_llm_message\(\)](#)

mistral	<i>Mistral Provider Function</i>
---------	----------------------------------

Description

The `mistral()` function acts as an interface for interacting with the Mistral API through main `tidyllm` verbs such as `chat()` and `embed()`. It dynamically routes requests to Mistral-specific functions like `mistral_chat()` and `mistral_embedding()` based on the context of the call.

Usage

```
mistral(..., .called_from = NULL)
```

Arguments

- `...` Parameters to be passed to the appropriate Mistral-specific function, such as model configuration, input text, or API-specific options.
- `.called_from` An internal argument that specifies which action (e.g., `chat`, `embed`, `send_batch`) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`, or a matrix for `embed()`).

mistral_chat	<i>Send LLMMessage to Mistral API</i>
--------------	---------------------------------------

Description

Send `LLMMessage` to Mistral API

Usage

```
mistral_chat(  
  .llm,  
  .model = "mistral-large-latest",  
  .frequency_penalty = NULL,  
  .logit_bias = NULL,  
  .presence_penalty = NULL,  
  .seed = NULL,  
  .stop = NULL,  
  .stream = FALSE,  
  .temperature = 0.7,  
)
```

```

        .top_p = 1,
        .min_tokens = NULL,
        .max_tokens = NULL,
        .json_schema = NULL,
        .safe_prompt = FALSE,
        .timeout = 120,
        .max_tries = 3,
        .dry_run = FALSE,
        .verbose = FALSE,
        .tools = NULL,
        .tool_choice = NULL
    )

```

Arguments

<code>.llm</code>	An LLMMessage object.
<code>.model</code>	The model identifier to use (default: "mistral-large-latest").
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
<code>.logit_bias</code>	A named list modifying the likelihood of specified tokens appearing in the completion.
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
<code>.seed</code>	If specified, the system will make a best effort to sample deterministically.
<code>.stop</code>	Up to 4 sequences where the API will stop generating further tokens.
<code>.stream</code>	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
<code>.temperature</code>	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
<code>.top_p</code>	An alternative to sampling with temperature, called nucleus sampling.
<code>.min_tokens</code>	The minimum number of tokens to generate in the completion. Must be >= 0 (optional).
<code>.max_tokens</code>	An upper bound for the number of tokens that can be generated for a completion.
<code>.json_schema</code>	A JSON schema object provided by tidyllm schema or ellmer schemata.
<code>.safe_prompt</code>	Whether to inject a safety prompt before all conversations (default: FALSE).
<code>.timeout</code>	When should our connection time out in seconds (default: 120).
<code>.max_tries</code>	Maximum retries to perform request
<code>.dry_run</code>	If TRUE, perform a dry run and return the request object (default: FALSE).
<code>.verbose</code>	Should additional information be shown after the API call? (default: FALSE)
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.tool_choice</code>	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

Returns an updated LLMMessage object.

mistral_embedding	<i>Generate Embeddings Using Mistral API</i>
-------------------	--

Description

Generate Embeddings Using Mistral API

Usage

```
mistral_embedding(  
    .input,  
    .model = "mistral-embed",  
    .timeout = 120,  
    .max_tries = 3,  
    .dry_run = FALSE  
)
```

Arguments

.input	A character vector of texts to embed or an LLMMessage object
.model	The embedding model identifier (default: "mistral-embed").
.timeout	Timeout for the API request in seconds (default: 120).
.max_tries	Maximum retries to perform request
.dry_run	If TRUE, perform a dry run and return the request object.

Value

A matrix where each column corresponds to the embedding of a message in the message history.

mistral_list_models	<i>List Available Models from the Mistral API</i>
---------------------	---

Description

List Available Models from the Mistral API

Usage

```
mistral_list_models(  
  .api_url = "https://api.mistral.ai",  
  .timeout = 60,  
  .max_tries = 3,  
  .dry_run = FALSE,  
  .verbose = FALSE  
)
```

Arguments

.api_url	Base URL for the API (default: "https://api.mistral.ai").
.timeout	Request timeout in seconds (default: 60).
.max_tries	Maximum number of retries for the API request (default: 3).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it.
.verbose	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include id and created), or NULL if no models are found.

ollama	<i>Ollama API Provider Function</i>
--------	-------------------------------------

Description

The ollama() function acts as an interface for interacting with local AI models via the Ollama API. It integrates seamlessly with the main tidyllm verbs such as chat() and embed().

Usage

```
ollama(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Ollama-specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument specifying the verb (e.g., chat, embed) the function is invoked from. This argument is automatically managed by tidyllm and should not be set by the user.

Details

Some functionalities, like `ollama_download_model()` or `ollama_list_models()` are unique to the Ollama API and do not have a general verb counterpart. These functions can be only accessed directly.

Supported Verbs:

- `chat()`: Sends a message to an Ollama model and retrieves the model's response.
- `embed()`: Generates embeddings for input texts using an Ollama model.
- `send_batch()`: Behaves different than the other `send_batch()` verbs since it immediately processes the answers

Value

The result of the requested action:

- For `chat()`: An updated `LLMMessage` object containing the model's response.
- For `embed()`: A matrix where each column corresponds to an embedding.

ollama_chat	<i>Interact with local AI models via the Ollama API</i>
-------------	---

Description

Interact with local AI models via the Ollama API

Usage

```
ollama_chat(
  .llm,
  .model = "gemma2",
  .stream = FALSE,
  .seed = NULL,
  .json_schema = NULL,
  .temperature = NULL,
  .num_ctx = 2048,
  .num_predict = NULL,
  .top_k = NULL,
  .top_p = NULL,
  .min_p = NULL,
  .mirostat = NULL,
  .mirostat_eta = NULL,
  .mirostat_tau = NULL,
  .repeat_last_n = NULL,
  .repeat_penalty = NULL,
  .tools = NULL,
  .tfs_z = NULL,
```

```

        .stop = NULL,
        .ollama_server = "http://localhost:11434",
        .timeout = 120,
        .keep_alive = NULL,
        .dry_run = FALSE
    )

```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history and system prompt.
<code>.model</code>	Character string specifying the Ollama model to use (default: "gemma2")
<code>.stream</code>	Logical; whether to stream the response (default: FALSE)
<code>.seed</code>	Integer; seed for reproducible generation (default: NULL)
<code>.json_schema</code>	A JSON schema object as R list to enforce the output structure (default: NULL)
<code>.temperature</code>	Float between 0-2; controls randomness in responses (default: NULL)
<code>.num_ctx</code>	Integer; sets the context window size (default: 2048)
<code>.num_predict</code>	Integer; maximum number of tokens to predict (default: NULL)
<code>.top_k</code>	Integer; controls diversity by limiting top tokens considered (default: NULL)
<code>.top_p</code>	Float between 0-1; nucleus sampling threshold (default: NULL)
<code>.min_p</code>	Float between 0-1; minimum probability threshold (default: NULL)
<code>.mirostat</code>	Integer (0,1,2); enables Mirostat sampling algorithm (default: NULL)
<code>.mirostat_eta</code>	Float; Mirostat learning rate (default: NULL)
<code>.mirostat_tau</code>	Float; Mirostat target entropy (default: NULL)
<code>.repeat_last_n</code>	Integer; tokens to look back for repetition (default: NULL)
<code>.repeat_penalty</code>	Float; penalty for repeated tokens (default: NULL)
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.tfs_z</code>	Float; tail free sampling parameter (default: NULL)
<code>.stop</code>	Character; custom stop sequence(s) (default: NULL)
<code>.ollama_server</code>	String; Ollama API endpoint (default: "http://localhost:11434")
<code>.timeout</code>	Integer; API request timeout in seconds (default: 120)
<code>.keep_alive</code>	Character; How long should the ollama model be kept in memory after request (default: NULL - 5 Minutes)
<code>.dry_run</code>	Logical; if TRUE, returns request object without execution (default: FALSE)

Details

The function provides extensive control over the generation process through various parameters:

- Temperature (0-2): Higher values increase creativity, lower values make responses more focused

- Top-k/Top-p: Control diversity of generated text
- Mirostat: Advanced sampling algorithm for maintaining consistent complexity
- Repeat penalties: Prevent repetitive text
- Context window: Control how much previous conversation is considered

Value

A new LLMMessage object containing the original messages plus the model's response

Examples

```
## Not run:
llm_message("user", "Hello, how are you?")
response <- ollama_chat(llm, .model = "gemma2", .temperature = 0.7)

# With custom parameters
response <- ollama_chat(
  llm,
  .model = "llama2",
  .temperature = 0.8,
  .top_p = 0.9,
  .num_ctx = 4096
)

## End(Not run)
```

ollama_delete_model	<i>Delete a model from the Ollama API</i>
---------------------	---

Description

This function sends a DELETE request to the Ollama API to remove a specified model.

Usage

```
ollama_delete_model(.model, .ollama_server = "http://localhost:11434")
```

Arguments

.model The name of the model to delete.

.ollama_server The base URL of the Ollama API (default is "http://localhost:11434").

ollama_download_model *Download a model from the Ollama API*

Description

This function sends a request to the Ollama API to download a specified model from Ollama's large online library of models.

Usage

```
ollama_download_model(.model, .ollama_server = "http://localhost:11434")
```

Arguments

`.model` The name of the model to download.
`.ollama_server` The base URL of the Ollama API (default is "http://localhost:11434").

ollama_embedding *Generate Embeddings Using Ollama API*

Description

Generate Embeddings Using Ollama API

Usage

```
ollama_embedding(  
  .input,  
  .model = "all-minilm",  
  .truncate = TRUE,  
  .ollama_server = "http://localhost:11434",  
  .timeout = 120,  
  .dry_run = FALSE  
)
```

Arguments

`.input` Aa character vector of texts to embed or an LLMMessage object
`.model` The embedding model identifier (default: "all-minilm").
`.truncate` Whether to truncate inputs to fit the model's context length (default: TRUE).
`.ollama_server` The URL of the Ollama server to be used (default: "http://localhost:11434").
`.timeout` Timeout for the API request in seconds (default: 120).
`.dry_run` If TRUE, perform a dry run and return the request object.

Value

A matrix where each column corresponds to the embedding of a message in the message history.

ollama_list_models	<i>Retrieve and return model information from the Ollama API</i>
--------------------	--

Description

This function connects to the Ollama API and retrieves information about available models, returning it as a tibble.

Usage

```
ollama_list_models(.ollama_server = "http://localhost:11434")
```

Arguments

.ollama_server The URL of the ollama server to be used

Value

A tibble containing model information, or NULL if no models are found.

openai	<i>OpenAI Provider Function</i>
--------	---------------------------------

Description

The openai() function acts as an interface for interacting with the OpenAI API through main tidyllm verbs such as chat(), embed(), and send_batch(). It dynamically routes requests to OpenAI-specific functions like openai_chat() and openai_embedding() based on the context of the call.

Usage

```
openai(..., .called_from = NULL)
```

Arguments

- ... Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or API-specific options.
- .called_from An internal argument that specifies which action (e.g., chat, embed, send_batch) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LLMMessage object for chat(), or a matrix for embed()).

openai_chat

Send LLM Messages to the OpenAI Chat Completions API

Description

This function sends a message history to the OpenAI Chat Completions API and returns the assistant's reply.

Usage

```
openai_chat(
  .llm,
  .model = "gpt-4o",
  .max_completion_tokens = NULL,
  .reasoning_effort = NULL,
  .frequency_penalty = NULL,
  .logit_bias = NULL,
  .presence_penalty = NULL,
  .seed = NULL,
  .stop = NULL,
  .stream = FALSE,
  .temperature = NULL,
  .top_p = NULL,
  .api_url = "https://api.openai.com/",
  .timeout = 60,
  .verbose = FALSE,
  .json_schema = NULL,
  .max_tries = 3,
  .dry_run = FALSE,
  .compatible = FALSE,
  .api_path = "/v1/chat/completions",
  .logprobs = NULL,
  .top_logprobs = NULL,
  .tools = NULL,
  .tool_choice = NULL
)
```

Arguments

.llm	An LLMMessage object containing the conversation history.
.model	The identifier of the model to use (default: "gpt-4o").

<code>.max_completion_tokens</code>	An upper bound for the number of tokens that can be generated for a completion.
<code>.reasoning_effort</code>	How long should reasoning models reason (can either be "low", "medium" or "high")
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
<code>.logit_bias</code>	A named list modifying the likelihood of specified tokens appearing in the completion.
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
<code>.seed</code>	If specified, the system will make a best effort to sample deterministically.
<code>.stop</code>	Up to 4 sequences where the API will stop generating further tokens.
<code>.stream</code>	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
<code>.temperature</code>	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
<code>.top_p</code>	An alternative to sampling with temperature, called nucleus sampling.
<code>.api_url</code>	Base URL for the API (default: "https://api.openai.com/").
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.verbose</code>	Should additional information be shown after the API call (default: FALSE).
<code>.json_schema</code>	A JSON schema object provided by tidyllm schema or ellmer schemata.
<code>.max_tries</code>	Maximum retries to perform request
<code>.dry_run</code>	If TRUE, perform a dry run and return the request object (default: FALSE).
<code>.compatible</code>	If TRUE, skip API and rate-limit checks for OpenAI compatible APIs (default: FALSE).
<code>.api_path</code>	The path relative to the base <code>.api_url</code> for the API (default: "/v1/chat/completions").
<code>.logprobs</code>	If TRUE, get the log probabilities of each output token (default: NULL).
<code>.top_logprobs</code>	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
<code>.tools</code>	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
<code>.tool_choice</code>	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

A new LLMMessage object containing the original messages plus the assistant's response.

openai_embedding	<i>Generate Embeddings Using OpenAI API</i>
------------------	---

Description

Generate Embeddings Using OpenAI API

Usage

```
openai_embedding(
  .input,
  .model = "text-embedding-3-small",
  .truncate = TRUE,
  .timeout = 120,
  .dry_run = FALSE,
  .max_tries = 3,
  .verbose = FALSE
)
```

Arguments

.input	An existing LLMMessage object (or a character vector of texts to embed)
.model	The embedding model identifier (default: "text-embedding-3-small").
.truncate	Whether to truncate inputs to fit the model's context length (default: TRUE).
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests (default: 3).
.verbose	Should information about current ratelimits be printed? (default: FALSE)

Value

A tibble with two columns: input and embeddings. The input column contains the texts sent to embed, and the embeddings column is a list column where each row contains an embedding vector of the sent input.

openai_list_models	<i>List Available Models from the OpenAI API</i>
--------------------	--

Description

List Available Models from the OpenAI API

Usage

```
openai_list_models(
  .api_url = "https://api.openai.com",
  .timeout = 60,
  .max_tries = 3,
  .dry_run = FALSE,
  .verbose = FALSE
)
```

Arguments

<code>.api_url</code>	Base URL for the API (default: "https://api.openai.com").
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.max_tries</code>	Maximum number of retries for the API request (default: 3).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it.
<code>.verbose</code>	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include id, created, and owned_by), or NULL if no models are found.

pdf_page_batch	<i>Batch Process PDF into LLM Messages</i>
----------------	--

Description

This function processes a PDF file page by page. For each page, it extracts the text and converts the page into an image. It creates a list of LLMMessage objects with the text and the image for multimodal processing. Users can specify a range of pages to process and provide a custom function to generate prompts for each page.

Usage

```
pdf_page_batch(
  .pdf,
  .general_prompt,
  .system_prompt = "You are a helpful assistant",
  .page_range = NULL,
  .prompt_fn = NULL
)
```

Arguments

.pdf	Path to the PDF file.
.general_prompt	A default prompt that is applied to each page if .prompt_fn is not provided.
.system_prompt	Optional system prompt to initialize the LLMMessage (default is "You are a helpful assistant").
.page_range	A vector of two integers specifying the start and end pages to process. If NULL, all pages are processed.
.prompt_fn	An optional custom function that generates a prompt for each page. The function takes the page text as input and returns a string. If NULL, .general_prompt is used for all pages.

Value

A list of LLMMessage objects, each containing the text and image for a page.

perplexity	<i>Perplexity Provider Function</i>
------------	-------------------------------------

Description

The `perplexity()` function acts as a provider interface for interacting with the Perplexity API through `tidyllm`'s `chat()` verb. It dynamically routes requests to Perplexity-specific function. At the moment this is only `perplexity_chat()`

Usage

```
perplexity(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Perplexity-specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument specifying which action (e.g., <code>chat</code> , <code>embed</code>) the function is invoked from. This argument is automatically managed by the <code>tidyllm</code> verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LLMMessage object for `chat()`).

perplexity_chat

*Send LLM Messages to the Perplexity Chat API***Description**

This function sends a message history to the Perplexity Chat API and returns the assistant's reply.

Usage

```
perplexity_chat(
    .llm,
    .model = "sonar",
    .max_tokens = 1024,
    .temperature = NULL,
    .top_p = NULL,
    .frequency_penalty = NULL,
    .presence_penalty = NULL,
    .stop = NULL,
    .search_domain_filter = NULL,
    .return_images = FALSE,
    .search_recency_filter = NULL,
    .api_url = "https://api.perplexity.ai/",
    .json = FALSE,
    .timeout = 60,
    .verbose = FALSE,
    .stream = FALSE,
    .dry_run = FALSE,
    .max_tries = 3
)
```

Arguments

<code>.llm</code>	An LLMMessage object containing the conversation history.
<code>.model</code>	The identifier of the model to use (default: "sonar").
<code>.max_tokens</code>	The maximum number of tokens that can be generated in the response (default: 1024).
<code>.temperature</code>	Controls the randomness in the model's response. Values between 0 (exclusive) and 2 (exclusive) are allowed, where higher values increase randomness (optional).
<code>.top_p</code>	Nucleus sampling parameter that controls the proportion of probability mass considered. Values between 0 (exclusive) and 1 (exclusive) are allowed (optional).
<code>.frequency_penalty</code>	Number greater than 0. Values > 1.0 penalize repeated tokens, reducing the likelihood of repetition (optional).

<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values encourage new topics by penalizing tokens that have appeared so far (optional).
<code>.stop</code>	One or more sequences where the API will stop generating further tokens. Can be a string or a list of strings (optional).
<code>.search_domain_filter</code>	A vector of domains to limit or exclude from search results. For exclusion, prefix domains with a "-" (optional, currently in closed beta).
<code>.return_images</code>	Logical; if TRUE, enables returning images from the model's response (default: FALSE, currently in closed beta).
<code>.search_recency_filter</code>	Limits search results to a specific time interval (e.g., "month", "week", "day", or "hour"). Only applies to online models (optional).
<code>.api_url</code>	Base URL for the Perplexity API (default: "https://api.perplexity.ai").
<code>.json</code>	Whether the response should be structured as JSON (default: FALSE).
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.verbose</code>	If TRUE, displays additional information after the API call, including rate limit details (default: FALSE).
<code>.stream</code>	Logical; if TRUE, streams the response piece by piece (default: FALSE).
<code>.dry_run</code>	If TRUE, performs a dry run and returns the constructed request object without executing it (default: FALSE).
<code>.max_tries</code>	Maximum retries to perform the request (default: 3).

Value

A new `LLMMessage` object containing the original messages plus the assistant's response.

<code>rate_limit_info</code>	<i>Get the current rate limit information for all or a specific API</i>
------------------------------	---

Description

This function retrieves the rate limit details for the specified API, or for all APIs stored in the `.tidyllm_rate_limit_env` if no API is specified.

Usage

```
rate_limit_info(.api_name = NULL)
```

Arguments

`.api_name` (Optional) The name of the API whose rate limit info you want to get. If not provided, the rate limit info for all APIs in the environment will be returned.

Value

A tibble containing the rate limit information.

`send_azure_openai_batch`*Send a Batch of Messages to Azure OpenAI Batch API*

Description

This function creates and submits a batch of messages to the Azure OpenAI Batch API for asynchronous processing.

Usage

```
send_azure_openai_batch(  
    .llms,  
    .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),  
    .deployment = "gpt-4o-mini",  
    .api_version = "2024-10-01-preview",  
    .max_completion_tokens = NULL,  
    .reasoning_effort = NULL,  
    .frequency_penalty = NULL,  
    .logit_bias = NULL,  
    .presence_penalty = NULL,  
    .seed = NULL,  
    .stop = NULL,  
    .temperature = NULL,  
    .top_p = NULL,  
    .logprobs = NULL,  
    .top_logprobs = NULL,  
    .dry_run = FALSE,  
    .overwrite = FALSE,  
    .max_tries = 3,  
    .timeout = 60,  
    .verbose = FALSE,  
    .json_schema = NULL,  
    .id_prefix = "tidyllm_azure_openai_req_"  
)
```

Arguments

<code>.llms</code>	A list of <code>LLMMessage</code> objects containing conversation histories.
<code>.endpoint_url</code>	Base URL for the API (default: <code>Sys.getenv("AZURE_ENDPOINT_URL")</code>).
<code>.deployment</code>	The identifier of the model that is deployed (default: <code>"gpt-4o-mini"</code>).
<code>.api_version</code>	Which version of the API is deployed (default: <code>"2024-10-01-preview"</code>)
<code>.max_completion_tokens</code>	Integer specifying the maximum tokens per response (default: <code>NULL</code>).

<code>.reasoning_effort</code>	How long should reasoning models reason (can either be "low", "medium" or "high")
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
<code>.logit_bias</code>	A named list modifying the likelihood of specified tokens appearing in the completion.
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
<code>.seed</code>	If specified, the system will make a best effort to sample deterministically.
<code>.stop</code>	Up to 4 sequences where the API will stop generating further tokens.
<code>.temperature</code>	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
<code>.top_p</code>	An alternative to sampling with temperature, called nucleus sampling.
<code>.logprobs</code>	If TRUE, get the log probabilities of each output token (default: NULL).
<code>.top_logprobs</code>	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
<code>.overwrite</code>	Logical; if TRUE, allows overwriting an existing batch ID (default: FALSE).
<code>.max_tries</code>	Maximum number of retries to perform the request (default: 3).
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).
<code>.verbose</code>	Logical; if TRUE, additional info about the requests is printed (default: FALSE).
<code>.json_schema</code>	A JSON schema object provided by tidyllm schema or ellmer schemata (default: NULL).
<code>.id_prefix</code>	Character string to specify a prefix for generating custom IDs when names in <code>.llms</code> are missing (default: "tidyllum_azure_openai_req_").

Value

An updated and named list of `.llms` with identifiers that align with batch responses, including a `batch_id` attribute.

send_batch

Send a batch of messages to a batch API

Description

The `send_batch()` function allows you to send a list of `LLMMessage` objects to an API. It routes the input to the appropriate provider-specific batch API function.

Usage

```

send_batch(
  .llms,
  .provider = getOption("tidyllm_sbatch_default"),
  .dry_run = NULL,
  .temperature = NULL,
  .timeout = NULL,
  .top_p = NULL,
  .max_tries = NULL,
  .model = NULL,
  .verbose = NULL,
  .json_schema = NULL,
  .seed = NULL,
  .stop = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .id_prefix = NULL
)

```

Arguments

<code>.llms</code>	A list of LLMMessage objects containing conversation histories.
<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllm_sbatch_default</code> option.
<code>.dry_run</code>	Logical; if TRUE, simulates the request without sending it to the provider. Useful for testing.
<code>.temperature</code>	Numeric; controls the randomness of the model's output (0 = deterministic).
<code>.timeout</code>	Numeric; the maximum time (in seconds) to wait for a response.
<code>.top_p</code>	Numeric; nucleus sampling parameter, which limits the sampling to the top cumulative probability p.
<code>.max_tries</code>	Integer; the maximum number of retries for failed requests.
<code>.model</code>	Character; the model identifier to use (e.g., "gpt-4").
<code>.verbose</code>	Logical; if TRUE, prints additional information about the request and response.
<code>.json_schema</code>	List; A JSON schema object as R list to enforce the output structure
<code>.seed</code>	Integer; sets a random seed for reproducibility.
<code>.stop</code>	Character vector; specifies sequences where the model should stop generating further tokens.
<code>.frequency_penalty</code>	Numeric; adjusts the likelihood of repeating tokens (positive values decrease repetition).
<code>.presence_penalty</code>	Numeric; adjusts the likelihood of introducing new tokens (positive values encourage novelty).

`.id_prefix` Character string to specify a prefix for generating custom IDs when names in `.llms` are missing

Value

An updated and named list of `.llms` with identifiers that align with batch responses, including a `batch_id` attribute.

send_claude_batch	<i>Send a Batch of Messages to Claude API</i>
-------------------	---

Description

This function creates and submits a batch of messages to the Claude API for asynchronous processing.

Usage

```
send_claude_batch(  
  .llms,  
  .model = "claude-3-5-sonnet-20241022",  
  .max_tokens = 1024,  
  .temperature = NULL,  
  .top_k = NULL,  
  .top_p = NULL,  
  .stop_sequences = NULL,  
  .json_schema = NULL,  
  .thinking = FALSE,  
  .thinking_budget = 1024,  
  .api_url = "https://api.anthropic.com/",  
  .verbose = FALSE,  
  .dry_run = FALSE,  
  .overwrite = FALSE,  
  .max_tries = 3,  
  .timeout = 60,  
  .id_prefix = "tidyllm_claude_req_"  
)
```

Arguments

- `.llms` A list of `LLMMessage` objects containing conversation histories.
- `.model` Character string specifying the Claude model version (default: "claude-3-5-sonnet-20241022").
- `.max_tokens` Integer specifying the maximum tokens per response (default: 1024).
- `.temperature` Numeric between 0 and 1 controlling response randomness.
- `.top_k` Integer for diversity by limiting the top K tokens.

.top_p	Numeric between 0 and 1 for nucleus sampling.
.stop_sequences	Character vector of sequences that halt response generation.
.json_schema	A schema to enforce an output structure
.thinking	Logical; if TRUE, enables Claude’s thinking mode for complex reasoning tasks (default: FALSE).
.thinking_budget	Integer specifying the maximum tokens Claude can spend on thinking (default: 1024). Must be at least 1024. Defaults to "tidyllm_claude_req_".
.api_url	Base URL for the Claude API (default: "https://api.anthropic.com/").
.verbose	Logical; if TRUE, prints a message with the batch ID (default: FALSE).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting an existing batch ID associated with the request (default: FALSE).
.max_tries	Maximum number of retries to perform the request.
.timeout	Integer specifying the request timeout in seconds (default: 60).
.id_prefix	Character string to specify a prefix for generating custom IDs when names in .llms are missing.

Value

An updated and named list of .llms with identifiers that align with batch responses, including a batch_id attribute.

send_groq_batch	<i>Send a Batch of Messages to the Groq API</i>
-----------------	---

Description

This function creates and submits a batch of messages to the Groq API for asynchronous processing.

Usage

```
send_groq_batch(  
  .llms,  
  .model = "deepseek-r1-distill-llama-70b",  
  .max_tokens = 1024,  
  .temperature = NULL,  
  .top_p = NULL,  
  .frequency_penalty = NULL,  
  .presence_penalty = NULL,  
  .stop = NULL,  
)
```

```

        .seed = NULL,
        .api_url = "https://api.groq.com/",
        .json = FALSE,
        .completion_window = "24h",
        .verbose = FALSE,
        .dry_run = FALSE,
        .overwrite = FALSE,
        .max_tries = 3,
        .timeout = 60,
        .id_prefix = "tidyllm_groq_req_"
    )

```

Arguments

<code>.llms</code>	A list of LLMMessage objects containing conversation histories.
<code>.model</code>	Character string specifying the model to use (default: "deepseek-r1-distill-llama-70b").
<code>.max_tokens</code>	Integer specifying the maximum tokens per response (default: 1024).
<code>.temperature</code>	Numeric between 0 and 2 controlling response randomness.
<code>.top_p</code>	Numeric between 0 and 1 for nucleus sampling.
<code>.frequency_penalty</code>	Number between -2.0 and 2.0 to penalize repetition.
<code>.presence_penalty</code>	Number between -2.0 and 2.0 to encourage new topics.
<code>.stop</code>	One or more sequences where the API will stop generating further tokens.
<code>.seed</code>	An integer for deterministic sampling.
<code>.api_url</code>	Base URL for the Groq API (default: "https://api.groq.com/").
<code>.json</code>	Whether the response should be structured as JSON (default: FALSE).
<code>.completion_window</code>	Character string for the batch completion window (default: "24h").
<code>.verbose</code>	Logical; if TRUE, prints a message with the batch ID (default: FALSE).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request objects without executing (default: FALSE).
<code>.overwrite</code>	Logical; if TRUE, allows overwriting an existing batch ID (default: FALSE).
<code>.max_tries</code>	Maximum number of retries to perform the request.
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).
<code>.id_prefix</code>	Character string to specify a prefix for generating custom IDs when names in <code>.llms</code> are missing.

Value

An updated and named list of `.llms` with identifiers that align with batch responses, including a `batch_id` attribute.

send_mistral_batch	<i>Send a Batch of Requests to the Mistral API</i>
--------------------	--

Description

This function creates and submits a batch of messages to the Mistral API for asynchronous processing.

Usage

```
send_mistral_batch(
    .llms,
    .model = "mistral-small-latest",
    .endpoint = "/v1/chat/completions",
    .metadata = NULL,
    .temperature = 0.7,
    .top_p = 1,
    .max_tokens = 1024,
    .min_tokens = NULL,
    .frequency_penalty = NULL,
    .logit_bias = NULL,
    .presence_penalty = NULL,
    .seed = NULL,
    .stop = NULL,
    .safe_prompt = FALSE,
    .json_schema = NULL,
    .dry_run = FALSE,
    .overwrite = FALSE,
    .max_tries = 3,
    .timeout = 60,
    .id_prefix = "tidyllm_mistral_req_"
)
```

Arguments

.llms	A list of LLMMessage objects containing conversation histories.
.model	The Mistral model version (default: "mistral-small-latest").
.endpoint	The API endpoint (default: "/v1/chat/completions").
.metadata	Optional metadata for the batch.
.temperature	Sampling temperature to use, between 0.0 and 1.5 (default: 0.7).
.top_p	Nucleus sampling parameter, between 0.0 and 1.0 (default: 1).
.max_tokens	The maximum number of tokens to generate in the completion (default: 1024).
.min_tokens	The minimum number of tokens to generate (optional).
.frequency_penalty	Numeric value (or NULL) for frequency penalty.

.logit_bias	A named list modifying the likelihood of specific tokens (or NULL).
.presence_penalty	Numeric value (or NULL) for presence penalty.
.seed	Random seed for deterministic outputs (optional).
.stop	Sequence(s) at which to stop generation (optional).
.safe_prompt	Logical; if TRUE, injects a safety prompt (default: FALSE).
.json_schema	A JSON schema object for structured output (optional).
.dry_run	Logical; if TRUE, returns the prepared request without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting existing custom IDs (default: FALSE).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).
.id_prefix	Prefix for generating custom IDs (default: "tidyllm_mistral_req_").

Value

The prepared LLMMessage list with a batch_id attribute.

send_ollama_batch	<i>Send a Batch of Messages to Ollama API</i>
-------------------	---

Description

This function creates and submits a batch of messages to the Ollama API. Contrary to other batch functions, this function waits for the batch to finish and receives requests. The advantage compared to sending single messages via chat() is that Ollama handles large parallel requests quicker than many individual chat requests.

Usage

```
send_ollama_batch(
  .llms,
  .model = "gemma2",
  .stream = FALSE,
  .seed = NULL,
  .json_schema = NULL,
  .temperature = NULL,
  .num_ctx = 2048,
  .num_predict = NULL,
  .top_k = NULL,
  .top_p = NULL,
  .min_p = NULL,
  .mirostat = NULL,
  .mirostat_eta = NULL,
```

```

.mirostat_tau = NULL,
.repeat_last_n = NULL,
.repeat_penalty = NULL,
.tfs_z = NULL,
.stop = NULL,
.ollama_server = "http://localhost:11434",
.timeout = 120,
.keep_alive = NULL,
.dry_run = FALSE
)

```

Arguments

<code>.llms</code>	A list of LLMMessage objects containing conversation histories.
<code>.model</code>	Character string specifying the Ollama model to use (default: "gemma2")
<code>.stream</code>	Logical; whether to stream the response (default: FALSE)
<code>.seed</code>	Integer; seed for reproducible generation (default: NULL)
<code>.json_schema</code>	A JSON schema object as R list to enforce the output structure (default: NULL)
<code>.temperature</code>	Float between 0-2; controls randomness in responses (default: NULL)
<code>.num_ctx</code>	Integer; sets the context window size (default: 2048)
<code>.num_predict</code>	Integer; maximum number of tokens to predict (default: NULL)
<code>.top_k</code>	Integer; controls diversity by limiting top tokens considered (default: NULL)
<code>.top_p</code>	Float between 0-1; nucleus sampling threshold (default: NULL)
<code>.min_p</code>	Float between 0-1; minimum probability threshold (default: NULL)
<code>.mirostat</code>	Integer (0,1,2); enables Mirostat sampling algorithm (default: NULL)
<code>.mirostat_eta</code>	Float; Mirostat learning rate (default: NULL)
<code>.mirostat_tau</code>	Float; Mirostat target entropy (default: NULL)
<code>.repeat_last_n</code>	Integer; tokens to look back for repetition (default: NULL)
<code>.repeat_penalty</code>	Float; penalty for repeated tokens (default: NULL)
<code>.tfs_z</code>	Float; tail free sampling parameter (default: NULL)
<code>.stop</code>	Character; custom stop sequence(s) (default: NULL)
<code>.ollama_server</code>	String; Ollama API endpoint (default: "http://localhost:11434")
<code>.timeout</code>	Integer; API request timeout in seconds (default: 120)
<code>.keep_alive</code>	Character; How long should the ollama model be kept in memory after request (default: NULL - 5 Minutes)
<code>.dry_run</code>	Logical; if TRUE, returns request object without execution (default: FALSE)

Details

The function provides extensive control over the generation process through various parameters:

- Temperature (0-2): Higher values increase creativity, lower values make responses more focused
- Top-k/Top-p: Control diversity of generated text
- Mirostat: Advanced sampling algorithm for maintaining consistent complexity
- Repeat penalties: Prevent repetitive text
- Context window: Control how much previous conversation is considered

Value

A list of updated LLMMessage objects, each with the assistant's response added if successful.

send_openai_batch	<i>Send a Batch of Messages to OpenAI Batch API</i>
-------------------	---

Description

This function creates and submits a batch of messages to the OpenAI Batch API for asynchronous processing.

Usage

```
send_openai_batch(
    .llms,
    .model = "gpt-4o",
    .max_completion_tokens = NULL,
    .reasoning_effort = NULL,
    .frequency_penalty = NULL,
    .logit_bias = NULL,
    .presence_penalty = NULL,
    .seed = NULL,
    .stop = NULL,
    .temperature = NULL,
    .top_p = NULL,
    .logprobs = NULL,
    .top_logprobs = NULL,
    .dry_run = FALSE,
    .overwrite = FALSE,
    .json_schema = NULL,
    .max_tries = 3,
    .timeout = 60,
    .verbose = FALSE,
    .id_prefix = "tidyllm_openai_req_"
)
```

Arguments

<code>.llms</code>	A list of LLMMessage objects containing conversation histories.
<code>.model</code>	Character string specifying the OpenAI model version (default: "gpt-4o").
<code>.max_completion_tokens</code>	Integer specifying the maximum tokens per response (default: NULL).
<code>.reasoning_effort</code>	How long should reasoning models reason (can either be "low", "medium" or "high")
<code>.frequency_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency in the text so far.
<code>.logit_bias</code>	A named list modifying the likelihood of specified tokens appearing in the completion.
<code>.presence_penalty</code>	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
<code>.seed</code>	If specified, the system will make a best effort to sample deterministically.
<code>.stop</code>	Up to 4 sequences where the API will stop generating further tokens.
<code>.temperature</code>	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
<code>.top_p</code>	An alternative to sampling with temperature, called nucleus sampling.
<code>.logprobs</code>	If TRUE, get the log probabilities of each output token (default: NULL).
<code>.top_logprobs</code>	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
<code>.overwrite</code>	Logical; if TRUE, allows overwriting an existing batch ID associated with the request (default: FALSE).
<code>.json_schema</code>	A JSON schema object provided by tidyllm_schema or ellmer schemata (default: NULL).
<code>.max_tries</code>	Maximum number of retries to perform the request (default: 3).
<code>.timeout</code>	Integer specifying the request timeout in seconds (default: 60).
<code>.verbose</code>	Logical; if TRUE, additional info about the requests is printed (default: FALSE).
<code>.id_prefix</code>	Character string to specify a prefix for generating custom IDs when names in <code>.llms</code> are missing (default: "tidymlm_openai_req_").

Value

An updated and named list of `.llms` with identifiers that align with batch responses, including a `batch_id` attribute.

tidyllm_schema

Create a JSON Schema for Structured Outputs

Description

This function creates a JSON schema for structured outputs, supporting both character-based shorthand and S7 `tidyllm_field` objects. It also integrates with `ellmer` types like `ellmer::type_string()` if `ellmer` is in your namespace

Usage

```
tidyllm_schema(name = "tidyllm_schema", ...)
```

Arguments

<code>name</code>	A character string specifying the schema name (default: "tidyllm_schema").
<code>...</code>	Named arguments where each name represents a field, and each value is either a character string, a <code>tidyllm_field</code> , or an <code>ellmer</code> type. Supported character shorthand types: • "character" or "string" for character fields • "logical" for boolean fields • "numeric" for number fields • "factor(...)" for enumerations • Use <code>[]</code> to indicate vectors, e.g., "character[]"

Value

A list representing the JSON schema, suitable for use with `.json_schema` in LLM API calls.

Examples

```
## Not run:
# Example using different field types
address_schema <- tidyllm_schema(
  name = "AddressSchema",
  Street = field_chr("A common street name"),
  house_number = field_dbl(),
  City = field_chr("Name of a city"),
  State = field_fct("State abbreviation", .levels = c("CA", "TX", "Other")),
  Country = "string",
  PostalCode = "string"
)

llm_message("Imagine an address") |> chat(openai, .json_schema = address_schema)

# Example with vector field
tidyllm_schema(
```

```

    plz = field_dbl(.vector = TRUE)
  )

  ## End(Not run)

```

tidyllm_tool

Create a Tool Definition for tidyllm

Description

Creates a tool definition for use with Language Model API calls that support function calling. This function wraps an existing R function with schema information for LLM interaction.

Usage

```
tidyllm_tool(.f, .description = character(0), ...)
```

Arguments

<code>.f</code>	The function to wrap as a tool
<code>.description</code>	Character string describing what the tool does
<code>...</code>	Named arguments providing schema definitions for each function parameter using <code>tidyllm_fields</code>

Details

Each parameter schema in `...` should correspond to a parameter in the wrapped function. All required function parameters must have corresponding schema definitions.

Value

A `TOOL` class object that can be used with `tidyllm chat()` functions

Examples

```

get_weather <- function(location){}
weather_tool <- tidyllm_tool(
  get_weather,
  "Get the current weather in a given location",
  location = field_chr("The city and state, e.g., San Francisco, CA")
)

```

`voyage`*Voyage Provider Function*

Description

The `voyage()` function acts as a provider interface for interacting with the Voyage.ai API through `tidyllm`'s verbs. It dynamically routes requests to voyage-specific functions. At the moment this is only `voyage_embed()`

Usage

```
voyage(..., .called_from = NULL)
```

Arguments

<code>...</code>	Parameters to be passed to the appropriate Voyage-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument specifying which action (e.g., <code>embed</code>) the function is invoked from. This argument is automatically managed by the <code>tidyllm</code> verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked

`voyage_embedding`*Generate Embeddings Using Voyage AI API*

Description

This function creates embedding vectors from text or multimodal inputs (text and images) using the Voyage AI API. It supports three types of input:

Usage

```
voyage_embedding(  
  .input,  
  .model = "voyage-3",  
  .timeout = 120,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .verbose = FALSE  
)
```

Arguments

<code>.input</code>	Input to embed. Can be: • A character vector of texts • An <code>LLMMessage</code> object (all textual components will be embedded) • A list containing a mix of character strings and <code>tidyllm_image</code> objects created with <code>img()</code>
<code>.model</code>	The embedding model identifier. For text-only: "voyage-3" (default). For multimodal inputs: "voyage-multimodal-3" is used automatically.
<code>.timeout</code>	Timeout for the API request in seconds (default: 120).
<code>.dry_run</code>	If TRUE, perform a dry run and return the request object without sending.
<code>.max_tries</code>	Maximum retry attempts for requests (default: 3).
<code>.verbose</code>	Should information about current rate limits be printed? (default: FALSE).

Details

1. Character vector: Embeds each text string separately
2. `LLMMessage` object: Extracts and embeds text content from messages
3. List of mixed content: Processes a combination of text strings and image objects created with `img()`

For multimodal inputs, the function automatically switches to Voyage's multimodal API and formats the response with appropriate labels (e.g., "[IMG] image.png") for images.

Value

A tibble with two columns: `input` and `embeddings`.

- The `input` column contains the input texts or image labels
- The `embeddings` column is a list column where each row contains an embedding vector

Examples

```
## Not run:
# Text embeddings
voyage_embedding("How does photosynthesis work?")

# Multimodal embeddings
list("A banana", img("banana.jpg"), "Yellow fruit") |>
  voyage_embedding()

## End(Not run)
```
